Population Bulletin of the United Nations
Nos. 37/38 – 1994
Special issue on the five regional population conferences and meetings convened as part of the substantive preparations for the International Conference on Population and Development

United Nations
New York, 1994
NOTE

The designations employed and the presentation of the material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.

The term "country" as used in the text of this publication also refers, as appropriate, to territories or areas.

In some tables, the designation "developed" and "developing" economies are intended for statistical convenience and do not necessarily express a judgement about the stage reached by a particular country or area in the development process.

The views expressed in signed papers are those of the individual authors and do not imply the expression of any opinion on the part of the United Nations Secretariat.

Papers have been edited and consolidated in accordance with United Nations practice and requirements.

PREFACE

The purpose of the Population Bulletin of the United Nations, as stipulated by the Population Commission, is to publish population studies carried out by the United Nations, its specialized agencies and other organizations with a view to promoting scientific understanding of population questions. The studies are expected to provide a global perspective of demographic issues and to weigh the direct and indirect implications of population policy. The Bulletin is intended to be useful to Governments, international organizations, research and training institutions and other bodies that deal with questions related to population and development.

Although the primary source of the material appearing in the Bulletin is the research carried out by the United Nations Secretariat, officials of governmental and non-governmental organizations and individual scholars are occasionally invited to contribute articles.

*Formerly the Department of International Economic and Social Affairs.

INTRODUCTION

In its resolution 1991/93 of 26 July 1991, the Economic and Social Council, in preparation for the International Conference on Population and Development, to be held at Cairo in 1994, invited the United Nations regional commissions to convene meetings or conferences to review the experience gained in population policies and programmes in their regions and to propose future action.

Five conferences were held. The Fourth Asian and Pacific Population Conference, organized by the Economic and Social Commission for Asia and the Pacific (ESCAP), in cooperation with the United Nations Population Fund (UNFPA), was hosted by the Government of Indonesia at Denpasar from 19 to 27 August 1992. The theme of the Conference was Population and Sustainable Development: Goals and Strategies into the Twenty-first Century. The Conference adopted the Bali Declaration on Population and Sustainable Development.

The Third African Population Conference was hosted by the Government of Senegal at Dakar from 7 to 12 December 1992. The Conference was organized by the Economic Commission for Africa (ECA), in cooperation with the Organization of African Unity (OAU) and UNFPA. The theme of the Conference was Population, Family and Sustainable Development. The Conference adopted the Dakar/Ngor Declaration on Population, Family and Sustainable Development.

The European Population Conference was held in Geneva, from 23 to 26 March 1993. Organized by the Economic Commission for Europe (ECE), in cooperation with the Council of Europe and UNFPA, the Conference involved countries in Europe and North America. The principal themes of the Conference were: international migration; fertility and the family; health and mortality; selected consequences of population growth and age structure; and international cooperation in the field of population. The Conference adopted a set of recommendations.

The Arab Population Conference was hosted by the Government of Jordan at Amman from 4 to 8 April 1993. The Conference was organized by the Economic and Social Commission for Western Asia (ESCWA), in cooperation with the League of Arab States and UNFPA. The Conference discussed population, environment and development; population growth and demographic structure; population distribution and internal migration; international migration; population and women; family planning, health and family well-being; and population policies and programmes. The Conference adopted the Second Amman Declaration on Population and Development.

The Latin American and Caribbean Regional Conference on Population and Development was hosted by the Government of Mexico at Mexico City from 29 April to 4 May 1993. It was organized by the Economic Commission
for Latin America and the Caribbean (ECLAC) and co-sponsored by UNFPA.
The main theme of the Conference was Population, Social Equity and Chang-
ing Production Patterns. The Conference adopted the Latin American and
Caribbean Consensus on Population and Development.

The present issue of the Population Bulletin is devoted to a review of the
results of those regional population conferences. It includes a synthesis of the
regional conferences, as well as the declarations, recommendations and con-
sensus statements on population and development that were adopted.
SYNTHESIS OF THE REGIONAL POPULATION CONFERENCES CONVENED AS PART OF THE SUBSTANTIVE PREPARATIONS FOR THE INTERNATIONAL CONFERENCE ON POPULATION AND DEVELOPMENT

COMMON CONCERNS AND PRIORITIES

The recommendations of the five regional conferences are both general and specific on the formulation and implementation of population and development policies and programmes. Those recommendations were addressed to Governments, intergovernmental and non-governmental organizations. Some of the more general concerns and priorities can be summarized as follows.

Human resources development should be the focus for policies and programmes for sustainable development. People are the most important and valuable resource that any nation possesses. The family should be regarded as the basic unit of society; Governments are, therefore, urged to incorporate family concerns into national development plans.

Population policies and programmes are considered an integral part of national development plans aimed at sustainable socio-economic development. Therefore, such policies and programmes should be fully formulated, implemented and integrated into all aspects of development planning and policy-making.

Policies and programmes aimed at sustainable development have been seriously hampered by the continuing prevalence of extreme poverty among vast groups in the developing world, particularly women and children, and the inequality between and within States. Unless countries are able to make substantial progress in alleviating poverty, development policies and programmes—including population-related policies and programmes—are likely to fail.

It is the basic right of couples and individuals to decide freely and responsibly the number and spacing of their children. In order to be able to exercise that right, individuals and couples must have free access to the necessary information and services. In addition, population policies and programmes should respect fundamental and universal human rights and treat people with dignity.

Notwithstanding the fact that major differences exist among the five regions and the countries within the regions with regard to demographic and
development issues, the recommendations of the five regional conferences shared certain specific concerns, opinions and priorities.

Population growth and structure

Population growth

Success in fertility regulation was reported in many parts or regions of the world. However, in some countries the rate of population growth, still high, was regarded as a serious problem with significant implications for the achievement of sustained economic growth and sustainable development. For many countries experiencing rapid population growth, the momentum of population increase in relation to, for instance, the provision of health-care services, employment opportunities, education, housing facilities, sewage treatment and waste disposal, was considered burdensome. The regional conferences stressed the need for countries with high fertility rates to reduce fertility.

Population structure

Many developing countries had a population structure in which nearly half of the population was under the age of 15. This posed specific challenges for Governments in those countries. In the fields of education, health care and job creation, the demands were likely to outstrip existing availability. The regional conferences stressed the need to extend social services, both in terms of quantity and quality, during the coming decade in order to accommodate the impending massive demands.

In the developed, industrialized countries, ageing was regarded as a demographic feature that needed specific attention. The Governments of those countries were urged to formulate and implement policies and programmes that would address the special needs of the elderly so as to enable them to live a healthy and, whenever possible, productive life. The European Population Conference recommended action to enhance the self-reliance of the elderly and to give high priority to the development of human resources as a way of dealing with the adverse effects of population ageing—for instance, by developing training programmes for caregivers.

Some developing countries, notably in Asia and Latin America, were also experiencing a rapid increase in the numbers of elderly people, owing to fertility declines in combination with increases in life expectancy at birth. As a result of changing family structure and size, caused by economic development and urbanization, some of those countries urgently needed to provide the necessary social services for their elderly people. Therefore, Governments were urged to develop strategies that took into account the changing age structure.
Interrelationship between population variables, the environment and sustainable development

Building on the debates that took place during the United Nations Conference on Environment and Development (UNCED) in Rio de Janeiro in 1992 and the adoption of Agenda 21, the regional conferences emphasized the interrelationships between population variables, natural resources and the environment, and sustainable development.

The regional conferences acknowledged the complexity of those relationships at the global, regional, national and local levels, and therefore urged that more research be undertaken on them. Conceptual frameworks and analytical tools needed to be developed further and the research findings used in policy decision-making.

Nevertheless, there was widespread consensus among the countries participating in the regional conferences that population growth and distribution could reinforce and sometimes accelerate certain processes of environmental degradation. The recommendations stressed the need to bring population growth rates and spatial distribution into balance with natural resources and the environment without delay.

Inequality and poverty

The recommendations emphasized that the root cause of environmental degradation and population growth in the developing countries was the inequality between and within States. This inequality had, on the one hand, resulted in excessive patterns of human consumption and production in the industrialized countries and among the elites in the developing countries and, on the other hand, in the abject poverty of vast groups of people in the developing countries. Poverty often left those people no other options than to exploit their natural resources, even beyond critical limits, out of sheer necessity. The regional conferences urged the Governments of the developed countries to encounter the problems of overconsumption and overproduction with great decisiveness. Sustainable development was likely to fail unless the issues of consumption, production and poverty were properly addressed.

Environmentally friendly technologies

The Governments of the developing countries were urged, wherever possible, to refrain from the introduction or use of technologies that were harmful to the environment. They should be assisted in the adoption of appropriate, environmentally friendly technologies and modes of production. Some of the conferences suggested the formulation and implementation of information programmes that would make people aware of the environmental consequences of certain patterns of consumption and production.
Health and family planning

Maternal and child health care

The health status of women and children, particularly in the developing countries, was a common concern. The regional conferences emphasized the need to reduce maternal, infant and child mortality rates in their countries rapidly. Two aspects deserved special attention. First, Governments were urged to improve the accessibility and utilization of maternal and child health-care (MCH) facilities, especially in rural areas and urban marginal communities. Secondly, the quality of MCH services, which was regarded as critical in increasing the utilization of the services, should be enhanced.

Family planning and reproductive health care

The recommendations in the area of reproductive health care emphasized the right of individuals and couples (the Arab Conference referred only to couples in this context) to decide freely and responsibly the number and spacing of their children. In order to be able to exercise that right, individuals and couples must have access to all the information and services needed. Therefore, Governments were requested to do their utmost to make contraceptive methods widely available and within reach of those wishing to make use of them, thereby satisfying the unmet need for family planning information and services among vast groups in both the developed and the developing countries. High priority should be given to the quality of care.

All five of the regional conferences stressed the need to integrate family planning services into an overall strategy that aimed at improving the health of women and children. Therefore, reproductive health-care services should be improved and/or extended. Reproductive health care referred to a strategy that incorporated, *inter alia*, services for prenatal care, obstetrics, post-natal care, counselling on family planning and contraceptive use, and maternal and child health care. The starting point of the strategy was the autonomy of women in all aspects of their lives. Because of the young age structure of many developing countries, an increase in the demand for maternal and child health and family planning (MCH/FP) services was expected.

The African, Arab and Latin American and the Caribbean Conferences stressed the need to explore ways of producing contraceptives within the region. The Governments were urged to strengthen national and regional biomedical research capacities.

The five regional conferences emphasized the need to give due attention within population policies and programmes to the study of infertility and childlessness. In particular, the sociocultural consequences of infertility and childlessness should be further explored.

Sexually transmitted diseases, human immunodeficiency virus and acquired immunodeficiency syndrome

The pandemic of acquired immunodeficiency syndrome (AIDS), the rapid increase in the number of people worldwide who were infected with the
human immunodeficiency virus (HIV), and the spread of sexually transmitted
diseases was addressed by all the regional conferences. There was general
care about the AIDS pandemic and sexually transmitted diseases. Govern-
ments were urged to formulate and implement policies and programmes
aimed at preventing the spread of HIV infection and sexually transmitted dis-
eases and educating people about the causes and consequences. Those pro-
grammes should pay special attention to high-risk groups, especially youth.

The role of men

All five of the regional conferences paid special attention to the role and
responsibilities of men in the field of family planning and child-rearing. Gov-
ernments were urged to design special information, education and communi-
cation programmes for men in order to make them aware of their responsibil-
ities with respect to family planning, contraceptive use, child-rearing and
responsible fatherhood. The Asian and Pacific Conference and the Latin
American and Caribbean Conference recommended that their Governments
increase male involvement in MCH/FP through the promotion of male contra-
ceptsives and information, education and communication methods.

Youth and adolescents

Four of the five regional conferences recommended that attention be paid
to the specific needs and problems of youth and adolescents with regard to
health, sexuality, contraceptive use, pregnancy and parenthood. Particularly
with regard to teenage pregnancies and AIDS, Governments were urged to
undertake education and information programmes that were specially
designed for teenagers and adolescents and to broaden health and family plan-
ing services for those groups.

Three of the five regional conferences emphasized the need to pay spe-
cial attention not only to the health and family planning needs of youth and
adolescents but also to the problems associated with access to education, par-
ticularly for girls and women, and unemployment. The African Conference
recommended the formulation and implementation of a comprehensive strat-
egy on youth that would comprise MCH and family planning services;
 improvement of the status, role and participation of youth in society; and pro-
vision of employment opportunities.

Abortion

An estimated 20-40 per cent of maternal deaths each year had been due
to the practice of unsafe abortions. Nevertheless, the issue of abortion was
sensitive. There was broad consensus that abortion should not be a contra-
ceptive method. Unwanted pregnancies, particularly among teenagers, consti-
tuted a major public health problem. Those pregnancies often ended in abor-
tion. The Latin American and Caribbean Conference called for more research
and study on that sensitive issue, with particular reference to the prevalence of
abortion and its impact on the health of women and their families. The pre-
vention of unwanted pregnancies should be given high priority.
Women in development

Improvement of the status and role of women

All five of the regional conferences emphasized that the status and role of women in society needed to be improved and that all barriers and discrimination that prevented women from participating at all levels of society should be removed. Governments were urged to give this topic high priority.

According to the recommendations of the regional conferences, women's concerns should be an integral part of all population and development policies and programmes and should be integrated at all stages of the policy-making process. Therefore, gender perspectives needed to be an essential part of the planning and implementation of national programmes.

Productive and reproductive rights of women

The recommendations stressed that the productive and reproductive rights of women should be fully recognized by Governments. Governments were urged to either abolish legal and other forms of discrimination against women or to pass legislation to enhance the status of women. The European Conference urged Governments to promote conditions that further stimulated political, economic and social equality between men and women.

Women and education

The low status of women in many countries was determined, inter alia, by the limited access of girls and women to formal and informal education. Governments were urged to remove the barriers that prevented women and girls from obtaining equal opportunities for education. Governments were requested to improve the accessibility of education for girls. The African Conference recommended the institutionalization and strengthening of programmes for reforming the educational system and vocational training so as to make it possible for women and girls to participate on an equal basis with men.

Women and the economy

Governments should be aware of the important role women play in the economy. Women contribute significantly to the income of households. In many parts of the world, female-headed households had already become a common phenomenon in society. Nevertheless, female labour was often not valued as such, or women were paid less than their male colleagues or were denied access to the formal labour market. The Latin American and Caribbean Conference urged Governments to facilitate the incorporation of women into the formal labour market and ensure their access to existing social security programmes.

Women and health

All the regional conferences recommended that special attention be paid to the issue of women and health. Women as well as men should have univer-
sal access to health programmes, including prenatal, obstetrical and post-natal care, and family planning information and services. Therefore, Governments were urged to further improve the accessibility and availability of health and family planning services. The Asian and Pacific Conference acknowledged that there was particular need for women-centred and women-managed facilities so as to ensure that women and their family planning and MCH needs were fully taken into consideration, and urged that reproductive health care be improved considerably.

**Urbanization, and internal and international migration**

**Urbanization**

The world was becoming urbanized. In the year 2000, half of the world’s population would live in urban areas and agglomerations. Governments were aware that they should take measures to accommodate the massive influx of people from the countryside and the growth of the urban population itself. Urbanization as such was not viewed as problematic, but the rapidity with which the urban population was growing and the question of how to incorporate migrants into the urban economy were matters of concern to the participants of the regional conferences. The Asian and Pacific Conference called for the implementation of strategies that recognized that urbanization was inevitable and that rural and urban development policies should not be undertaken in isolation from each other.

Governments were urged to improve the management and administrative abilities of city councils to deal with the process. There was a general call to decentralize the decision-making process to regional and municipal bodies. Also, local communities should be involved in the planning and management of city policies.

Further, the environmental and health consequences of urbanization were of general concern. Industrial pollution, vehicular emissions, industrial and household waste were or would become major problems in most urban centres in the world. They should be taken into account in national and urban development plans. The regional conferences recommended that the complexity of urban management necessitated greater cooperation at the various administrative levels.

**Internal migration**

The Arab Conference and the African Conference recommended that rural-urban migration be curbed by implementing integrated rural development programmes. The Latin American and Caribbean Conference, considering the depressing situation of many rural areas, recommended that Governments promote rural development strategies in both economic and social terms.

All the regional conferences recommended that Governments involve the private sector in the urbanization process by creating a favourable climate for that sector to invest in smaller towns and cities, in order to divert migration away from mega-cities.
The Arab Conference urged Governments to promote reliable data on internal population movements in order to be able to formulate adequate strategies on rural-urban migration. In addition, the Asian and Pacific Conference recommended that more detailed studies be undertaken to assess the economic impact of rural-urban migration.

**International migration**

International migration was high on the agenda of the five regional conferences. It was considered a worldwide phenomenon which needed special attention. All regional conferences stressed the need for international cooperation and agreements on the issue. Uncontrolled international migration flows were considered undesirable. Governments of sending and receiving countries should cooperate in redressing the root causes of international migration, such as poverty and inequality, unemployment, war and environmental degradation. Governments were requested to establish international agreements on migration policies. The recommendations of the regional conferences emphasized the need for international cooperation in the standardization of entry procedures. The Latin American and Caribbean Conference also recommended international agreements to prevent the brain drain of highly qualified and skilled persons.

All regional conferences called upon Governments to do their utmost to respect and ensure the human rights of migrants and to assist them with integration in the countries of destination.

International migration was considered a normal feature of human behaviour and therefore not negative as such. The African Conference recognized the importance of migratory flows within Africa and between Africa and other continents. The European Conference emphasized that Governments of countries of destination had the right to control access to their territories and to adopt policies that shaped immigration flows.

The dissemination of information on international migration was highly recommended by most of the regional conferences. There was a generally felt need for thorough understanding of the causes of international migration and its effects on the economic and social situation in both the countries of origin and of destination.

**Refugees and asylum-seekers**

All Governments were called upon to take appropriate measures to protect the rights of refugees and asylum-seekers and to adopt fair, reliable and efficient procedures. In addition, the regional conferences urged Governments to provide adequate services for refugees and other displaced persons.

To eliminate the root causes of the refugee situation, Governments were urged to do their utmost to promote socio-economic development, avoidance of international and internal conflicts, good governance, democratization, respect for human rights, and environmental protection. Countries facing massive influxes of refugees should be supported so that they could provide refugees and asylum-seekers with the necessary services.
Role of non-governmental organizations

Involvement of non-governmental organizations

There was broad international consensus on the pioneering and significant contributions that non-governmental organizations and other segments of the private sector could make with regard to the formulation and implementation of population and development policies and programmes. Therefore, the five regional conferences urged Governments to involve non-governmental organizations, wherever possible and appropriate, as partners in the planning and implementation of their population, health and development programmes.

Strengthening of non-governmental organizations

Governments should support and, where necessary, strengthen non-governmental organizations in order to supplement government programmes in such fields as health care, family planning, poverty alleviation and environmental conservation.

Data collection, analysis and research

Data collection and analysis

All the regional conferences emphasized the need for continued improvement in the collection and standardization of population and demographic data; for improving efficiency in the processing and analysis of data; and for the development of uniform standards of database development.

All the regional conferences recommended that special attention be given to the training of specialists in the fields of demographic data collection, processing and analysis. Governments were urged to strengthen national and regional institutes responsible for data collection and analysis in order to facilitate policy formulation and implementation.

All the regional conferences stressed the need for international cooperation with regard to data collection and analysis and the dissemination and exchange of relevant population and development information. Countries were encouraged to cooperate by sharing experiences and technical expertise in the regions.

Research and training

Major attention in all the recommendations was given to the need for and importance of scientific research on population and its related issues. It was stressed that the research should be of an applied nature so as to facilitate policy formulation and implementation. On the other hand, knowledge of demographic trends and other related subjects should be given due consideration by policy makers.

All the regional conferences recommended that research in the following fields should be intensified: demography; fertility and human reproduction; the interrelationship between population, natural resources, the environment, poverty and sustainable development; internal and international migration; the role and status of women and their reproductive health needs; the factors that
either inhibit or advance the integration of family planning services into existing services in the field of maternal and child health care; and effective integration of the aged and elderly into the mainstream of the social and economic development.

In order to improve and strengthen population-related research in the countries and regions, due attention should be given to the training of research specialists. Governments and the international community were requested to encourage technical and scientific cooperation in population and development research.

International cooperation and resource mobilization

International cooperation

All the regional conferences adopted recommendations that stressed the need for and the importance of international cooperation in the field of population and development. Cooperation between the regions and between countries within the regions was also emphasized. The European Conference recommended that special attention be given to the African region, where population-related problems were particularly serious.

There was broad international consensus that population assistance should be permanently based on respect for fundamental human rights and the responsible exercise of such rights by all individuals.

Again, the role and importance of non-governmental organizations in the field of international cooperation was emphasized in the regional conferences. Governments should involve non-governmental organizations in the planning and implementation of international cooperation programmes in the field of population and development.

Resource mobilization

In order to be able to implement all the recommendations adopted by the five regional conferences, Governments and the international donor community were urgently requested to increase, both financially and technically, their assistance in the field of population on a permanent basis. Reference was made to the Amsterdam Declaration on Better Life for Future Generations in which Governments and donors were urged to increase their assistance in the field of population to a total of US$ 9 billion by the year 2000. The Asian and Pacific Conference and the African Conference urged Governments and donors to allocate at least 4 per cent of official development assistance to population activities, as requested in the Amsterdam Declaration.

Political commitment

The recommendations of the five regional conferences stressed that, in order to achieve sustainable development and a population growth that would be in balance with the natural resource base, political commitment, both in terms of policy-making and financial support, was essential. Without such commitment one should not expect any progress in reducing population growth rates in countries with high fertility rates or the achievement of sus-
tained economic growth and sustainable development. Therefore, Governments were urged to address population and development issues with great seriousness and to do their utmost to tackle the problems related to those issues.

REGIONAL NEEDS AND PRIORITIES

Although there was much consensus among the five regions with respect to various topics within the fields of population and development, every region and all the countries within the regions had their own particular goals, needs and priorities. The following paragraphs highlight some of the specific regional concerns.³

ECA region

The Conference noted that Africa was facing a wide range of population and development-related problems. Population growth rates were high, as were maternal, infant and child mortality rates. The debt crisis, in combination with structural adjustment programmes and the overall economic situation, had resulted in insufficient resources for the efficient and effective implementation of national population programmes. However, it should be noted that every individual country had its own problems, needs and priorities.

The African countries agreed to strive to reduce the overall annual population growth rate from 3.0 to 2.5 per cent by the year 2000 and to 2.0 per cent by the year 2010. In order to reach those goals, the contraceptive prevalence rate should increase from 10 to 20 per cent by the year 2000 and to 40 per cent by the year 2010.

Life expectancy at birth had increased from 49 years in 1984 to 51 years in 1992. By the year 2000, life expectancy at birth should have increased to at least 55 years. In addition, infant mortality should be reduced to 50 per 1,000 births and child mortality to 70 per 1,000 or less. Programmes must be implemented that aim at reducing maternal mortality by at least 50 per cent from the 1990 level by the year 2000. Such programmes should include services and studies focused on reducing the increasing problem of unsafe abortions, estimated to cause 30-50 per cent of maternal mortality in parts of Africa.

Refugees

Refugees constituted a specific problem for African countries. Governments were requested to tackle the acute problems of refugees and displaced persons by setting up an integrated plan capable of dealing with the root causes and offering solutions for the immediate, medium and long terms. Measures should be undertaken to protect the rights of refugees. Governments should give priority in policy-making to elimination of the underlying causes of the refugee situation through negotiation, conflict resolution, democratization and respect for human rights. In addition, Governments should ensure that adequate services were being provided for refugees and displaced persons.
International cooperation

The international donor community was requested to continue and further increase its support to African countries in the fields of population and development and to consider the conversion of African debts into grants. In addition, UNFPA was requested to consider Africa as a priority region. African Governments should ensure that adequate planning and budget allocations were devoted to national population and socio-economic development programmes.

In addition, the Third African Population Conference recommended the strengthening of South/South cooperation in training, exchange of information, sharing of experiences, know-how and technical expertise.

ECE region

The Conference observed that the countries of Europe and North America were experiencing a sustained period of low, and at times unprecedentedly low, levels of fertility. Fertility continued to be well below the level of replacement. Even though in a few countries slight increases had been observed recently, the general expectation was that substantial increases in fertility were unlikely to occur. Many countries were still evaluating the socio-economic implications of long-term population decline and the phenomenon of ageing of the population. In addition, an ever-increasing number of women were trying to achieve personal fulfilment both in their family and professional lives. A great challenge for societies was to create conditions that enabled men and women to combine parental and work roles in a responsible manner.

Although the use of contraceptive methods had been widely practised in the region, there were still individuals and couples who did not have access to or made insufficient use of appropriate methods of fertility regulation. High rates of unintended pregnancies and abortion attested to the problem, notably in Eastern Europe.

Improvements in health promotion, disease prevention and treatment had affected morbidity and mortality levels and trends in most Western countries, and further gains were expected. At the same time, new problems had arisen, such as the AIDS pandemic, drug abuse and the influence of environmental degradation on health and mortality. Disparities between Western and Eastern Europe in various demographic indicators, such as maternal and infant mortality and life expectancy, suggested the need for improved health care, including reproductive health services, in Eastern Europe.

Ageing

The continued low levels of fertility and declining mortality at higher ages had a direct impact on population growth and the age structure of the countries in Europe and North America. Those trends had important socio-economic and political implications. In many countries “ageing policies” were already being developed in order to be able to adjust to changes in the composition and size of the labour force. Governments were urged to fur-
ther develop such policies since the already high expenditures on health and retirement benefits were likely to increase with the ageing of populations.

Policy makers were urged to give due consideration to past and current demographic trends and knowledge. The European Population Conference gave high priority to the development of human resources as a way of dealing with the effects of an ageing population. The Governments of the region were also urged to develop measures to enhance the self-reliance of the elderly and to facilitate their continued participation in society.

**International migration**

International migration was high on the political agenda of the countries in the region. Most countries in the region had been experiencing a considerable net influx of temporary or permanent migrants. The most crucial questions to be faced were how to control and manage the migratory flows to and within Europe in a humane and effective way, and how to achieve a desirable level of integration. It was felt that there was a clear need for increased cooperation within Europe in the field of international migration. According to the European Population Conference, the Governments of countries of destination had the right to control access to their territories. Immigration was not regarded as a solution for adjusting the age structure of the societies.

The Conference recommended that Governments of origin and of destination should, in order to alleviate the massive and uncontrolled international migration flows, seek to redress the causes of emigration by increasing efforts to achieve sustained economic and social development, avoid international and internal conflicts, respect the rule of law, promote good governance, strengthen democracy, promote human rights, support education, nutrition, health and population-relevant programmes, and ensure effective environmental protection. Those efforts might require financial assistance, the reassessment of commercial and tariff relations and full access to world markets, and stepped-up efforts on the part of the developing countries to create the framework for a market-oriented economy and liberal trading system.

**Countries in transition**

The health, population and development problems of Eastern European countries, the so-called “countries in transition”, were given much attention by the European Population Conference. The revival of old national and ethnic rivalries not only facilitated the outbreak of armed conflicts and serious political crises but also exacerbated demographic problems. Governments in the region were requested, as a matter of urgency, to assist the countries in transition in the field of population issues. Key elements should be financial support, technical back-stopping, training and exchange of information, experience and expertise.

Governments and regional organizations should assist the countries in transition in the field of reproductive health care, including family planning. The countries in transition should also be assisted to implement reforms in health systems and to develop policies and implement integrated programmes related to health population environment issues.
**ECLAC region**

Despite the severe economic crises that the region had been facing and in some cases was still facing, the Conference stated that real progress had been achieved with regard to demographic indicators. One of the most outstanding demographic changes in Latin America and the Caribbean in the past 25 years had been the pronounced decline in fertility, from 6.0 to 3.5 children per woman. The decline reduced the annual average population growth rate of the region to 2 per cent by the second half of the 1980s. The growth rate had been projected to fall to 1.7 per cent annually in the 1990s. At the same time, life expectancy at birth rose from 57 to 69 years, contributing to the ageing of the population within the countries, although the regional differences were diverse. Within the region, life expectancy at birth ranged from less than 60 to nearly 75 years. Those differences also meant that there were countries in the region where the population had been growing at an annual rate of 3 per cent and others where the rate had been less than 1 per cent.

Another remarkable demographic feature of the region had been the rapid process of urbanization. Currently, some 71 per cent of the population lived in urban areas, largely as a result of heavy internal migratory flows. Latin America, with less than 10 per cent of the world population, had four of its 10 most populous cities. The situation was not identical in all countries of the region, since some countries still had rural populations that accounted for more than 60 per cent of the total population.

**Regional plan of action**

Considering the importance of the consensus reached during the Conference on various topics in the population and development field, the member States decided to promote the adoption of a regional plan of action, based on the Latin American and Caribbean Consensus on Population and Development, adopted at the Conference. The plan of action would include the regional and country-specific goals and needs of the region. The ECLAC secretariat was requested to draw up a draft plan, in collaboration with UNFPA. The draft plan would be presented at the twenty-first session of ECLAC, to be held in Colombia, and submitted as a contribution to the preparatory process for the International Conference on Population and Development.

**Teenage pregnancies and abortion**

Taking into account the high prevalence of teenage pregnancies in the region, most of which were unplanned, Governments were requested to design and adopt global reproductive health-care models for teenagers, with special emphasis on family life education, comprehensive sex education and family planning. Governments were also urged to reconsider regulations restricting teenagers' access to birth control methods.

Abortion was considered by the Latin American and Caribbean Consensus as a major public health issue in the region, which should be treated with great sensitivity. It could never be regarded as a method of regulating fertility. Nevertheless, it was recommended that Governments devote greater attention
to the study and follow-up of the issue, particularly with regard to the impact of abortion on the health of women and their families.

**Sterilization**

Given the high prevalence of tubal ligation in some countries of the region, and taking into account the irreversibility of that contraceptive method, Governments were encouraged to strengthen the advisory services that informed potential users of sterilization about the existence of alternative contraceptive methods and the consequences of choosing a permanent method.

**Indigenous people**

The Latin American and Caribbean Consensus took into account the fact that various indigenous people lived in the region who survived in often precarious, marginal living conditions and still ran the risk of extinction. Therefore, Governments were urged to adopt, in the short term, population policies and programmes that considered the need to safeguard and protect the specific cultural traits of indigenous peoples while at the same time recognizing and respecting their space, land, language and systems of values and beliefs.

**ESCWA region**

The Conference affirmed that from a demographic point of view, the ESCWA region had undergone tremendous change. The most remarkable change was its growth in population, which had increased from 132 million in 1974 to about 237 million in 1992. It was expected to grow to 449 million by the year 2020. Governments were urged to achieve appropriate population growth rates through the provision of services needed to attain national policy goals. In addition, Governments should strive to minimize mortality rates, especially female mortality due to pregnancy-related complications.

**Migration, migrants and refugees**

Governments were urged to promote more inter-Arab coordination of population policies, with particular reference to migration and the movement of labour. The Amman Declaration, adopted at the Arab Population Conference, recommended the development and implementation of a world migration survey. Also, countries should promote policies and programmes aimed at reaching a geographical distribution of the population in step with the requirements of sustainable development and a healthy environment. Governments were requested to rationalize urban growth and improve the quality of life in rural areas through the promotion of integrated rural development programmes with economic, social and environmental dimensions. In such ways they would achieve population stability in those areas and curb rural-urban migration.

According to the Amman Declaration, all possible ways and means should be adopted to protect the rights of migrants, refugees and persons forced to move by upheavals and wars, especially women and children.
Receiving countries, especially the least developed among them, should be given international support in accommodating those groups until they returned to their home countries.

The specific health and population problems and needs of the Palestinian people were given attention in the Amman Declaration. It recommended action to relieve the sufferings of Palestinian families by raising the standards of public health, maternal and child health care and family protection programmes.

International cooperation

In order to improve understanding of Arab population issues and promote regional cooperation in the field of population, ESCWA and the League of Arab States were called upon to increase and expand the scope of their contributions. Emphasis was placed on the role of Arab funds in financing country and regional projects and research relating to population activities.

ESCAP region

The Conference estimated that the population of the countries and areas in Asia and the Pacific region was expected to increase from 3.2 billion in mid-1992 to 4.1 billion in the year 2010. The current annual population growth rate was estimated at 1.7 per cent, although there were major regional differences. The bulk of the population increase during the coming decades was expected to occur in South Asia, where the annual population growth rate was not expected to fall much below 2 per cent.

The average total fertility rate was estimated at 3.1 children per woman, with regional variations. The lowest fertility was measured in East Asia at 2.1 children per woman; the highest had been in South Asia at 4.3 children. A similar disparity existed with respect to infant mortality. In South Asia infant mortality was estimated at 90 per 1,000 births, which was more than three times the rate in East Asia, where it was 26 per 1,000 births.

The Conference urged Governments to further reduce population growth rates by adopting strategies aimed at attaining replacement level of 2.1 children per woman by the year 2010 or sooner. In addition, countries should strive to reduce infant mortality to 40 per 1,000 births or lower during the same period, and maternal mortality should be reduced to at least half the 1990 level by the year 2010.

Migration

The growing demand for overseas workers in countries and areas of the ESCAP region in which the demographic transition had been completed would become of increasing policy importance. In addition, the gender selectivity of the migrants had been changing gradually, because more and more women were migrating independently. Governments were urged to take measures to protect the rights of migrants, particularly of women and children. Further, policies should be implemented to assist persons displaced by environmental calamities.
Ageing

With significant and rapid fertility declines and improvements in mortality, population ageing would assume greater importance in the region in the near future. With rapid industrialization, urbanization and the increasing frequency of both spouses engaging in full-time paid work, traditional family support systems for the elderly would be placed under considerable strain, according to the Conference. Therefore, Governments were urged to formulate long-term development strategies that took into account the changing age structure. Strengthening of the family support system was also recommended, as was specific research on the effective integration of aged people into the mainstream of development.

International cooperation

The need to mobilize additional resources was currently greater than ever, according to the Conference. Therefore, the international donor community was requested to increase the international budget for programme support and financial assistance to the ESCAP region. Further, technical cooperation among developing countries should be encouraged.

NOTES

2 See A/C.2/44/6, annex.

3 The population estimates given in this section were those used in the official Conference documents. They may differ from the demographic estimates and projections prepared by the Population Division of the Department for Economic and Social Information and Policy Analysis of the United Nations Secretariat.
FOURTH ASIAN AND PACIFIC POPULATION CONFERENCE

The Fourth Asian and Pacific Population Conference was held at Denpasar, Indonesia, from 19 to 27 August 1992. The theme of the Conference was Population and Sustainable Development: Goals and Strategies into the Twenty-first Century. Prior to the Conference, three preparatory seminars were held: on population, environment and sustainable development (Jomtien, Thailand, 13-18 May 1991); on migration and urbanization (Seoul, 21-25 January 1992); and on planning and implementation of family planning/family health and welfare programmes (Beijing, China, 17-21 March 1992). The Conference, jointly sponsored by the Economic and Social Commission for Asia and the Pacific (ESCAP) and the United Nations Population Fund (UNFPA), consisted of a meeting of senior officials (19-25 August 1992), followed by a two-day ministerial meeting (26-27 August 1992). The Conference adopted the Bali Declaration on Population and Sustainable Development, which spells out regional goals and recommendations for population and sustainable development into the twenty-first century.

THE BALI DECLARATION ON POPULATION AND SUSTAINABLE DEVELOPMENT

PREAMBLE

We, the members and associate members of the Economic and Social Commission for Asia and the Pacific (ESCAP), having convened at the Fourth Asian and Pacific Population Conference at Bali, Indonesia, from 19 to 27 August 1992, have reviewed the population situation and outlook and noted the substantial progress achieved by the countries of the region in responding to the Asia-Pacific Call for Action on Population and Development, adopted by the Third Asian and Pacific Population Conference held at Colombo in 1982. We express concern that population issues remain among the most pressing challenges facing the region and, in addressing the theme of the present Conference, Population and Sustainable Development: Goals and Strategies into the Twenty-first Century, we

Recognize that:

(a) Population factors play a decisive role in all human endeavours, especially in safeguarding the environment and the pursuit of sustainable development. Accordingly, population considerations must be fully integrated into all aspects of planning and policy-making;
(b) Sustainable development as a means to ensure human well-being, equitably shared by all people today and in the future, requires that the interrelationships between population, resources, the environment and development should be fully recognized, properly managed and brought into a harmonious, dynamic balance;

(c) Full consideration of population concerns is crucial to any strategy to achieve sustainable development and to give future generations an environmental legacy better than that received by the present generation;

(d) An integrated approach incorporating population, resources, the environment and development elements must be pursued, although understanding of the complex interrelationships between these elements is still at an early stage. To do otherwise would endanger the attainment of sustainable development and narrow the options available to future generations;

(e) Measures to improve the status, role and participation of women must be given high priority, both because women have a fundamental right to enjoy equality with men in all aspects of life and because women play a critical role in, and must fully participate in, the sustainable development process;

(f) The alleviation of poverty is fundamental to the achievement of sustainable development;

**Emphasize** that:

(a) Population problems have local, national, regional and global ramifications and must therefore be addressed at all these levels;

(b) Every country has its own specific array of population problems and policy objectives and has the sovereign right to pursue its own population goals, policies and programmes with regard to the goal of global sustainable development;

(c) Dealing with population problems requires strengthening of social policies as well as regional and international cooperation; and

(d) Rapid population growth and the consequent changes in demographic structure and uneven population distribution are crucial factors that impose pressures and constraints on economic development efforts, the environment and natural resources, as well as social conditions. However, these factors are often neglected in environmental and economic development strategies that regard population as a neutral factor rather than a dynamic variable requiring policy intervention;

**Affirm** that:

(a) In showing concern for human well-being, population policies should recognize that individuals are members of the family, community, society, State and global community, and they possess rights within those contexts;

(b) Population size, growth, distribution, structure, composition and mobility should be considered at all levels of planning and in the formulation of comprehensive population policies;
(c) Resolution of population concerns is central to achieving equitable and efficient development of human resources and alleviation of poverty;

Note with appreciation:

(a) The efforts and progress made by the countries of the Asian and Pacific region in demographic, social, economic and development spheres and the leadership exhibited by political leaders and parliamentarians in the formulation and implementation of national policies and programmes dealing with population and development issues and problems;

(b) The invaluable contributions of United Nations organizations, especially ESCAP and UNFPA, and other intergovernmental organizations and multilateral agencies in providing technical and financial support for population programmes in the Asian and Pacific region;

(c) The contributions of donor countries through bilateral development assistance programmes;

(d) The pioneering and significant contributions that non-governmental organizations have made to population efforts in the region;

Keeping in mind:

Urge that:

(a) All members and associate members of ESCAP make a firm political and financial commitment to incorporate population and environmental concerns fully in all national efforts to achieve sustainable development;

(b) All members and associate members of ESCAP establish a set of population targets in line with sustainable development goals, and initiate and implement policies and programmes to achieve those targets;

(c) The ESCAP secretariat accord high priority and take appropriate action to assist members and associate members in implementing their population, environmental and development policies, programmes and strategies;

(d) UNFPA strengthen its programme support and mobilize the needed resources to help the members and associate members of ESCAP in implementing their population policies, programmes and strategies;

(e) Other United Nations organizations, international agencies and non-governmental organizations support the members and associate members
of ESCAP in implementing their population, environmental and development policies, programmes and strategies;

**Adopt:**

The following goals and recommendations for population and sustainable development into the twenty-first century.

**POPULATION GOALS**

Within the overall objectives of sustainable development, the goals of population policy should be to achieve a population growth that allows a better quality of life without jeopardizing the environment and the resource base of future generations. Population policy goals should also take cognizance of basic human rights as well as responsibilities of individuals, couples and families.

The population of countries and areas in the Asian and Pacific region amounted to 3.2 billion in mid-1992. Although there has been a significant decline in the rate of population growth over the past two decades and the current annual growth rate of 1.7 per cent is expected to continue to decline steadily, it is projected that 920 million people will be added to the region’s total by 2010. The bulk of the increase will occur in South Asian countries and least developed countries, where annual population growth rates are not expected to fall much below 2 per cent. It is in these least developed countries that the problems of poverty are most acute, and pressures on the education, health and employment sectors are greatest.

Fertility, as measured by the total fertility rate, currently averages 3.1 per woman in the Asian and Pacific region. However, there are substantial variations between and within the subregions of Asia and the Pacific. Fertility is lowest in East Asia, at 2.1 children per woman. It is highest in South Asia, at 4.3 children per woman. A similar marked disparity is exhibited in subregional levels of mortality. For example, infant mortality in South Asia, at 90 per 1,000 births is more than three times the rate in East Asia, where it is 26 per 1,000 births.

In many countries of the Asian and Pacific region, urban populations are expanding at three or four times the rate of the national population. The region will witness a significant increase in the number and size of urban areas, particularly of “mega-cities” and other large metropolitan areas. Furthermore, new issues, such as environmental degradation, ageing, imbalanced population distribution and international migration, are emerging and require priority consideration.

To help reduce high rates of population growth, countries and areas should adopt strategies to attain replacement level fertility, equivalent to about 2.2 children per woman, by the year 2010 or sooner. Countries and areas should also strive to reduce the level of infant mortality to 40 per 1,000 live births or lower during the same period. In countries and areas in which mater-
nal mortality is high, efforts should be made to reduce it by at least half by the year 2010.

RECOMMENDATIONS

Population, environment and development

Issues

Among the ultimate objectives of sustainable development are to achieve a balance between human needs and aspirations and population, resources and the environment, and to enhance the quality of life today and in the future. There is an urgent need to bring into equilibrium population dynamics, socio-economic development, the use of natural resources and environmental quality. Special attention should be paid to decreasing the demand for natural resources generated by unsustainable consumption and to using those resources efficiently in order to minimize depletion and reduce pollution. Although consumption patterns are very high in certain parts of the world, the basic consumer needs of a large section of humanity are not being met.

In many countries and areas, high rates of population growth and concentration have caused environmental problems, such as land degradation, air and water pollution, threats to biological diversity from habitat destruction and rising sea level due to the greenhouse effect. In some countries, calamities and associated loss of life have followed the extension of human settlements into marginal and vulnerable areas, especially along rivers, coasts and foothills.

Recommendations

Recommendation 1. More research should be undertaken to improve understanding of the complex synergy between population, resources, environment and development. Moreover, this knowledge must be used in formulating policies and strategies for sustainable development. The conceptual framework and appropriate analytical tools and indicators need to be developed further.

Recommendation 2. A comprehensive data collection and information system on key aspects of population, development and resource linkages that have implications for environmental quality must be developed to support planning, implementation and management, and evaluation of, as well as research on, population and sustainable development programmes.

Recommendation 3. Governments should formulate policies and strategies and implement programmes regarding appropriate technologies, keeping in view the interaction between population and environment, as well as their long-term sustainability. Such policies could include development of environmentally friendly technology, reforestation, improvement of the quality of air and water, waste recycling and the phasing out of environmentally harmful technology. Furthermore, countries should formulate enforceable measures to
promote greater harmony between population, resources, environment and development so as to achieve improved quality of life on a sustainable basis.

Recommendation 4. There is a need for appropriate interdisciplinary programmes to develop information, education and communication (IEC) activities, human resources, and environmental and population-related educational materials for all groups in the community. In this regard institutions at all levels, governmental and non-governmental, formal and informal, private and public sector, should be involved and supported.

Urbanization, internal and international migration

Issues

Population movements in countries and areas of the ESCAP region have greatly increased in scale and complexity. Voluntary population mobility has become an option to improve the life chances and opportunities of a much wider group of people in the region than ever before. This increased potential for significant population mobility within and between countries has major social, economic and environmental implications. In particular, increasing demand for overseas workers in countries and areas of the ESCAP region in which the demographic transition has been completed will become of increasing policy importance.

The gender selectivity of migrants is gradually changing as more and more women in the ESCAP region are migrating independently. This phenomenon has opened considerable opportunities to improve the role and status of women. However, growing numbers of migrant women work and live in situations in which they are vulnerable to exploitation.

The increasing tendency for people to concentrate in large metropolitan cities in the region presents a number of new and important management challenges for policy makers and planners.

Recommendations

Recommendation 5. Governments should reassess policies relating to urbanization and seek to implement policies recognizing that urbanization is inevitable. These policies should stress human resources development and be concerned with the environment and sustainable development and improvement in the quality of life in cities and the countryside, particularly in slums and other disadvantaged areas.

Recommendation 6. Linkages between rural and urban areas are of such strength and significance that rural and urban development should not be undertaken in isolation from each other, and therefore comprehensive planning should be undertaken.

Recommendation 7. Spatial implications and environmental consequences of major sectoral policies should be fully assessed as part of the national development planning process.

Recommendation 8. Sectors in which there is either labour shortage or labour surplus need to be identified to facilitate the development of policies to
achieve a better matching of the distribution of job opportunities on the one hand and labour supply on the other.

Recommendation 9. In view of the importance of the informal sector in absorbing large numbers of migrants and other workers in many countries and areas of the region, measures should be taken to improve the living standards of workers in the informal sector in a manner that is consistent with the principles of sustainable development.

Recommendation 10. Measures should also be taken to protect the rights of migrants, particularly women and children, and to improve their access to services and working conditions.

Recommendation 11. Recognizing the importance of decentralization for sustainable development, more decision-making power and resources should be transferred to regional and municipal bodies. Local communities need to have more involvement in planning, management and revenue collection. The complexity of management, services and infrastructure in large urban agglomerations necessitates greater cooperation between various administrative areas and levels.

Recommendation 12. Policies need to be developed to involve the private and public sectors in adequately accommodating the growth of mega-cities and to create opportunities in rural areas and smaller cities to divert migration away from mega-cities. To cope with rapid urbanization government should create a favourable climate for private sector investment in smaller towns and cities and provide the required support mechanisms, such as physical and social infrastructure, and favourable fiscal and monetary policies.

Recommendation 13. Existing data sources for the study of urbanization, migration and development at the national and international levels should be fully utilized. Research that seeks explicitly to measure the costs and benefits of rural-to-urban migration should be undertaken. Migration impact should be studied in greater detail. Data collection systems to obtain better information on forms of short-term migration or circulation within national boundaries as well as international movements need to be developed. Governments should strive to adopt more consistent and comparable data collection systems on international movements and develop measures to share the data and information.

Recommendation 14. Further steps should be taken to monitor adequately trends in international migration and to develop appropriate policies to accommodate and plan for future needs.

Recommendation 15. There should be greater cooperation among countries and areas of the region to ensure that the rights of international migrants under the International Labour Organisation (ILO) Convention concerning Migrations in Abusive Conditions and the Promotion of Equality of Opportunity and Treatment of Migrant Workers are protected and their working and living conditions safeguarded.

Recommendation 16. Steps should be taken to develop policies and programmes to prepare for and accommodate people displaced by environmental calamities.
Family planning and maternal and child health

Issues

Family planning and maternal and child health (MCH) programmes have played an important role in influencing population growth and improving the quality of life and human resources development in the countries of Asia and the Pacific. The success of family planning and MCH programmes is closely associated with the improved role and status of women; lower infant, child and maternal mortality rates; better birth-spacing and breast-feeding practices; and the delivery of services by trained personnel. Nevertheless, much remains to be done. There is a pressing need to strengthen programmes and adopt innovative approaches and strategies. To a large extent the success of programmes depends upon empowering individuals, families and communities to plan for themselves, as well as to design and implement, programmes based on their own needs.

Recommendations

Recommendation 17. Family planning and MCH programmes should undertake comprehensive and critical reviews of existing policies and programme strategies, as follows:

(a) In countries where the programmes have not yet achieved the desired objectives, priority should be given to strengthening policy development and related processes as well as to expanding and streamlining delivery systems of family planning and MCH within the primary health care framework, to adopting innovative management and multisectoral approaches, and to encouraging wider community and intersectoral participation in programme implementation efforts;

(b) In countries where fertility has been reduced to a low or acceptable level, programme strategies should aim to build upon achievements made so far with a view to attaining sustainability.

Recommendation 18. Efforts should be made to improve the accessibility and utilization of family planning and MCH services for men as well as women, taking into account the changing preferences and needs of clients and rapidly changing technologies. There is a particular need for women-centred and women-managed facilities to ensure that women and their family planning and MCH needs are fully taken into consideration. Counselling and information on the use of all MCH services and methods of family planning should be freely available. Resources should be allocated to upgrade and improve the quality of services and prevent attrition among skilled workers. Governments should develop the skills of service providers and improve the accessibility and logistics of family planning and MCH services.

Recommendation 19. Reproductive health care should be improved considerably in the region. Policies and programmes should strive to incorporate the totality of reproductive health care and aim at reducing maternal morbidity and mortality, induced abortion, sterility, childlessness, sexually transmitted diseases (STDs) and spread of the human immunodeficiency virus (HIV) and acquired immunodeficiency syndrome (AIDS).
Recommendation 20. Special attention should be focused on countries with high fertility and high population growth rates, especially the small island nations of the Pacific and Indian oceans.

Recommendation 21. Family planning and MCH programmes should encourage healthful birth-spacing and breast-feeding. They should always make available and offer birth-spacing methods of family planning.

Recommendation 22. Sustained efforts should be made to increase the involvement of males in family planning and to promote the use of family planning methods designed for males. Specific IEC strategies should be developed to inform and educate men about family planning and fertility regulation.

Recommendation 23. There should be population IEC programmes and services specifically designed for youth and adolescents to minimize the incidence of unplanned adolescent pregnancies and associated health risks.

Recommendation 24. There is a need to upgrade management information systems (MIS) so that they can provide timely and good quality information and to adopt appropriate strategies, such as rapid and independently conducted low-cost surveys, for the proper monitoring and evaluation of programmes. There is also a need to train MCH service providers and programme managers in the use of such information for these purposes.

Recommendation 25. There is an urgent need to incorporate family planning in the syllabuses of medical, nursing and other health-profession training institutions and in training programmes for health and family planning personnel.

Recommendation 26. Concerted efforts should be made to undertake relevant research studies and to translate the findings into action through their incorporation in ongoing policies and programmes.

Recommendation 27. Factors relating to problems of integrating family planning and MCH programmes should be determined and studied in order to formulate and implement such programmes in line with the socio-cultural, political and administrative conditions in each country.

Recommendation 28. Non-governmental organizations should continue their roles in support of national programmes. Governments should collaborate with, and enhance the potential of, non-governmental organizations by: (a) involving them in the development of innovative programmes, especially for vulnerable segments of the population; (b) ensuring that through their flexibility they are able to offer a greater variety of client-responsive services; (c) encouraging them to strengthen their grass-roots networks and community participative strategies; (d) putting to best advantage their advocacy function; and (e) enhancing their role as good quality service providers.

Population and human resources development

Issues

People are the most important and valuable resource that any nation possesses. It is crucial, therefore, that countries ensure that all individuals be given the opportunity to make the most of their potential. Such a policy, as
noted in the Jakarta Plan of Action on Human Resources Development in the
ESCAP Region, will result in the enhancement of social and economic develop-
ment of the community as a whole.

It is recognized that demographic factors are strategically important in
human resources development because of their interrelationships with
employment, education, skill and capability development, health and nutrition,
and the status and role of women.

Recommendations

**Recommendation 29.** Governments should recognize the key role played
by human resources in national development and give strong emphasis in
national planning and policy-making to the development of human resources.
Where this has not yet been done, policy and planning bodies should be estab-
lished at a high level to ensure that human resources development is given
appropriate recognition.

**Recommendation 30.** Human resources development planners should
recognize that individuals value education, health and other human resource
investments as important elements in the quality of their life. Therefore, pro-
grammes of human resources development should be linked to the strong
interest of people in availing themselves of these important elements of wel-
fare.

**Recommendation 31.** More attention should be given to the formulation
of policies to cope with the socio-economic consequences of the change in the
number of persons in certain age groups, as well as overall growth in number,
on fields such as education, employment, food and nutrition, housing and
health and welfare services.

**Recommendation 32.** Governments should improve human resources
development programmes, especially vocational and occupational training in
both rural and urban areas, to open up a wider range of employment options
for people living in areas characterized by a surplus of labour. Efforts should
be made to promote training in a variety of contexts including the workplace,
the family and the community.

**Women and population**

**Issues**

Women’s status, as reflected in their legal rights, education, health,
employment, position in the household and family decision-making power,
ffects demographic behaviour such as age at marriage, fertility, and infant,
child and maternal mortality. These in turn have an impact on the improve-
ment of women’s status and their participation in the development process.

In recognition of the importance of women’s contribution to develop-
ment and the need to improve the status and role of women, many countries
have begun to formulate policies and implement programmes. Despite some
progress, women in many countries still do not enjoy equal status with men,
have only a limited role in national socio-economic development and remain
unaware of their rights. For the achievement of sustainable development, the
full and unfettered participation of women is essential, especially in the formulation and implementation of population policies and programmes, because they have as much, if not more, at stake as men in whatever action is taken in these areas.

Given that women play an important role as managers of resources and in maintaining environmental quality, they must be involved in all decision-making relating to population and sustainable development.

Recommendations

Recommendation 33. Governments are urged to adopt and implement national policies and programmes to ensure equal opportunities for females in all sectors of social and economic development as well as political participation. Gender concerns should be incorporated in national development planning. Specific guidelines should be drawn up for the integration of women in all sectors of national development with a view to supporting their productive and reproductive roles and their equal partnerships in national development. Appropriate mechanisms should be developed or strengthened so that the needs of women at all levels are reflected in national population and development policies and programmes.

Recommendation 34. In order for females to benefit from the opportunities resulting from the elimination of discrimination, efforts should be intensified to improve their health status, especially in the field of reproductive health and nutrition, and to ensure equal access of girls and women to education, training and employment as well as credit and other supportive services for promoting self-employment particularly among the poor. Concerted efforts should be made to reduce constraints and to facilitate the participation of women in the mainstream of social and economic activities.

Recommendation 35. In line with the recommendations made by the Asia-Pacific Regional Assembly on “Women and Environment: Partners in Life”, held at Bangkok in 1991, women should be empowered with greater decision-making authority and their viewpoints should be considered at all levels to enable better management of resources and protection of the environment.

Recommendation 36. Governments should ensure that women are neither restricted from participating nor forced to participate in the labour force for reasons of demographic policy or cultural tradition. Furthermore, the reproductive role of women should in no way be used as a reason for limiting women’s right to work. Governments should take the initiative in removing any barriers to the realization of that right and, in cooperation with the private sector, should create opportunities and supporting facilities so that activities outside the home can be combined as appropriate with child-rearing and household activities. Efforts should also be made to ensure greater involvement of men in all areas of family responsibility. Women’s productive and reproductive rights should be fully recognized by Governments and supported by society at large.

Recommendation 37. Governments should strengthen national capabilities for collecting, analysing and monitoring gender-specific data and infor-
mation to facilitate better integration of women's concerns in development planning and implementation.

Recommendation 38. All forms of discrimination against women, legislative and otherwise, should be abolished.

Population and poverty alleviation

Issues

There is a complex interrelationship between rapid population growth and poverty. Some developing countries in the region have improved the living conditions of their peoples appreciably, but in many developing countries the numbers of the poor, hungry and illiterate have increased. Poverty is very closely interrelated with environmental degradation.

Population growth rates are faster in the least developed countries and areas where poverty is severe and there is less access to education and health services. At the microlevel, the poor usually have large families and are less aware of, and have less access to, social services such as family planning and MCH; this contributes to high infant, child and maternal mortality. Among the poor, children and women are especially vulnerable to exploitation.

Although rapid progress in the provision of social and health services in developing countries has occurred during the past decade, the services are unevenly distributed among urban-rural areas and socio-economic groups.

Recommendations

Recommendation 39. Governments should formulate more effective strategies and measures to alleviate poverty. These should include:

(a) Implementation of integrated population and development policies and programmes, including family planning and MCH strategies, that will slow population growth and produce faster income growth as well as reduce family size, improve education and productivity, and provide better life chances;

(b) Provision of adequate and efficient basic social and health services and facilities to improve well-being and increase human capital and skills among the poor, so that they can respond rapidly to income-generating opportunities and gain access to social programmes such as education, basic health care, improved sanitation, good quality nutrition, food subsidies, family planning and housing, and thus help to improve their living conditions and alleviate poverty;

(c) Equity in the allocation of resources and access to services should be important elements of national policy.

Recommendation 40. Governments should design policies and strategies to ensure that the benefits of development are shared by a wide spectrum of the population. This would help to break the cycle of poverty and slow population growth.

Recommendation 41. Governments should formulate long-term policies and programmes to tackle population growth and poverty jointly because of
their complementarities and strong synergy. The policies and programmes should be responsive to poor people’s needs, particularly in education, training, and family planning and MCH programmes.

**Recommendation 42.** When economic restructuring occurs, Governments need to take steps to minimize its adverse impacts upon the poor and underprivileged.

**Recommendation 43.** Priority should be given to research on the linkages and interactions between poverty, population dynamics, resources and the environment. The results of such research can be used in the design of policies and implementation of strategic programmes.

**Mortality and morbidity**

**Issues**

Mortality has declined significantly in most Asian and Pacific countries and areas. In some countries of the region, however, the expectation of life at birth remains below 55 years. Even in countries where mortality has declined, there are subregions and subgroups exposed to high levels of mortality and morbidity. Infants and children, and women in the reproductive ages, remain particularly susceptible. Mortality and morbidity patterns are expected to change in the future in a number of countries and areas owing to the increasing incidence of sexually transmitted diseases and HIV/AIDS, with grave consequences for the health, well-being and productivity of the people. This would also hamper the reproductive potential of the population. In addition, the incidence of degenerative diseases is increasing in the developing countries of the region.

Further reductions in mortality and morbidity will depend upon improvements in the quality of health services delivery, implementation of programmes targeted at the most disadvantaged groups, and the achievement and maintenance of a higher quality of life.

**Recommendations**

**Recommendation 44.** In countries where infant, child and maternal mortality continues to be high, the factors responsible need to be identified in order to formulate policies and implement appropriate programmes for the further reduction of such mortality.

**Recommendation 45.** Governments should strengthen their basic health infrastructure and manpower, and ensure the provision of equipment and supplies for improving affordable health-services delivery.

**Recommendation 46.** In view of the rapid spread of HIV/AIDS in the region and its increasing cumulative prevalence, countries and areas should initiate IEC programmes to educate their populations about the prevention of HIV/AIDS infection; such information should be included as an element in family planning programmes. Governments should collect data to monitor the trend of HIV/AIDS infection and design strategies and implement programmes to control its spread.
Recommendation 47. There is a need for Governments to strengthen research on the levels and patterns of morbidity and mortality changes associated with changes in the environment, life-styles and occupations as development proceeds. Health and medical service programmes should be modified to take account of these changes in patterns of mortality and morbidity.

Ageing

Issues

Population ageing is closely interrelated with the dynamic processes of demographic and socio-economic change, with implications for the family, community and nation. With significant and rapid fertility declines and improvements in mortality, population ageing will assume greater importance in the future.

The majority of the elderly have considerable potential for both self-reliance and making contributions to their families and communities. They have a right and a responsibility to make those contributions.

The family is still the principal source of support for the elderly. However, with rapid industrialization, urbanization and the increasing frequency of both spouses engaging in full-time paid work, traditional family support systems for the elderly will be placed under considerable strain.

Recommendations

Recommendation 48. Governments are urged to formulate long-term development strategies that take into consideration the changing age structure of the population, in particular the implications of population ageing for economic and social development. Development policies and programmes must take into account the characteristics of future cohorts of older people, their potential for involvement in the process of development and the role of the family and community in caring for the elderly.

Recommendation 49. Comprehensive programmes that aim to increase the support and contributions of the elderly should involve all sectors and levels of government, as well as non-governmental organizations, the private sector and unions.

Recommendation 50. Efforts should be made to develop policies and programmes at the local level to bring the active elderly into the mainstream of economic and social development and to enhance their contributions to their families and communities. This may include lifelong education programmes.

Recommendation 51. The family support system should be strengthened by providing economic incentives, such as tax exemptions and special privileges to families taking care of their elderly members.

Recommendation 52. It is important to recognize the differing needs of the rural and urban elderly in developing countries, particularly in those lacking social security systems.
Recommendation 53. Communities should be encouraged to form voluntary and mutual aid organizations to provide support for the elderly and their families.

Recommendation 54. Broad information and educational programmes should be introduced to create awareness and understanding of the issues of ageing and to instil moral and social values related to the support of older people. Such programmes should be targeted at families and the general public, with special emphasis on the younger generation.

Recommendation 55. Appropriate training programmes should be developed for caregivers such as medical and paramedical staff, residential care providers, community and social workers and family members, keeping in view the perspectives of both the caregivers and the elderly.

Recommendation 56. Research is needed on the interrelationship of ageing with changes in family patterns and structure and cultural and traditional change, the findings of which would promote effective integration of the elderly into the mainstream of economic and social development, and the formulation and implementation of appropriate policies and programmes.

Population data, research and information dissemination

Issues

While considerable progress has been made in information and database development within the region during past decades, there remains an urgent need to improve the content, quality and timeliness of data and to upgrade national skills for research, policy analysis and the development of integrated management information systems. Furthermore, small-area data sets need to be developed for decentralized and local-level planning.

Recommendations

Recommendation 57. Governments are urged to strengthen methodologies for collecting quality data and to improve efficiency in the processing and analysis of data for policy formulation, strategy development and programme implementation. Countries should devote more effort to upgrading analytical skills in the areas of policy analysis, monitoring and evaluation. In particular, national census, vital registration and survey organization capabilities should be strengthened and enhanced.

Recommendation 58. The creation of computerized databases, both numeric and bibliographic, at the national, regional and subregional levels should be encouraged for the more efficient dissemination and sharing of population data and information. In particular, there is a need to develop small-area databases for local and community area planning.

Recommendation 59. Governments should give priority to the application of modern information technologies and to the development of the human resources and skills needed to manage them in order to maximize the utilization of data and information at the national level.
Recommendation 60. National population information systems should be strengthened and should follow the framework of the Population Information Network (POPIN).

Recommendation 61. Coordination among national, subregional and regional information centres and networks representing various social and economic sectors should be strengthened to foster increased intersectoral networking, thereby assisting in the more complete integration of population with other aspects of development.

Recommendation 62. Governments are urged to attach high priority to population research, both for its continuous contribution to population policy formulation, programme implementation and evaluation and as a means to fill gaps in knowledge. Countries should establish, strengthen and maintain population research centres.

Recommendation 63. In support of this effort, regional and international organizations should establish standards related to database development, such as data format, structure and software, to promote the compatibility of databases created by the national information centres and their utilization at the national and regional levels.

Resource mobilization

Issues

Over the years, population programmes have become more diverse and complex. National-level population programmes have been established in many of the countries of the region and have achieved varying degrees of success. Nevertheless, much remains to be done, requiring large amounts of resources, both human and financial. The need for mobilizing additional resources is greater today than ever before.

Recommendations

Recommendation 64. The International Forum on Population in the Twenty-first Century, held at Amsterdam in November 1989, called for a doubling of resources by the year 2000 to support population programmes. It is estimated that about US$ 9 billion per year will be required to support core population programmes around the world, a substantial proportion of it in the Asian and Pacific region. Towards this end, the option of allocating 4 per cent of official development assistance to population programmes could be considered. In this regard, the important role of UNFPA in mobilizing the needed resources should be recognized, and countries are requested, as appropriate, to increase their contributions to UNFPA.

Recommendation 65. A central challenge all nations face today is to mobilize additional resources to support broad-based population programmes. The Fourth Asian and Pacific Population Conference urges all Governments, intergovernmental and non-governmental organizations, the private sector and external donors to make every effort to increase, on a regular basis, their financial commitment so as to attain their targets by the year 2000.
Recommendation 66. Over the past decade, several members and associate members of ESCAP have successfully formulated and implemented population policies and programmes. The experience and knowledge gained in the process are very valuable and can be shared with members and associate members still striving to attain their desired population goals. Those successful members and associate members are urged to allocate resources for the transfer of knowledge and skills—through the exchange of expertise, the sharing of information and knowledge and the facilitation of training—to countries that are in the process of attaining their demographic goals and objectives. Such technical cooperation among developing countries (TCDC) should be encouraged. Within the framework of existing institutions, appropriate mechanisms need to be identified to facilitate TCDC in the region and with other regions.

Recommendation 67. The emerging population issues in the region will become more diverse and complex during the 1990s, requiring flexible and innovative approaches to sustain the achievements made in the last three decades. UNFPA should provide the needed financial assistance to enable ESCAP to play an enhanced role in assisting the Governments of developing countries in the region in shaping their future population policies and programmes. In addition, UNFPA is requested to provide programme support and financial assistance to countries for the design and implementation of their population policies in accordance with national priorities, working closely with government officials to ensure effective coordination and harmonization of population activities, and to develop fully the national capacity for self-reliance.
THIRD AFRICAN POPULATION CONFERENCE

The Third African Population Conference, organized by the Economic Commission for Africa (ECA), in cooperation with the Organization of African Unity (OAU) and the United Nations Population Fund (UNFPA), was held at Dakar from 7 to 12 December 1992. The Conference, whose theme was Population, Family and Sustainable Development, examined the following major issues: the implementation of the Kilimanjaro Programme of Action for African Population and Self-reliant Development; the African family in the context of socio-economic development; strategies for sustainable development; emerging population problems and new orientations and strategies; and population policies and programmes in Africa. The Conference adopted the Dakar/Ngor Declaration on Population, Family and Sustainable Development.

DAKAR/NGOR DECLARATION ON POPULATION, FAMILY AND SUSTAINABLE DEVELOPMENT

PREAMBLE

We, the Governments of African countries represented by our Ministers responsible for population matters at the Third African Population Conference, which met at Dakar from 7 to 12 December 1992 on the theme Population, Family and Sustainable Development, have assessed the demographic situation and future trends in the region. In preparation for the International Conference on Population and Development to be held at Cairo in 1994, we have also assessed the achievements, constraints and implications of population policies, and the impact of the economic crisis and structural adjustment programmes on family survival strategies and on the ability of African Governments to make satisfactory progress in population policy formulation and implementation.

We have reviewed the lessons and prospects of implementing the Kilimanjaro Programme of Action which, inter alia, was aimed at accelerating self-reliant, social and economic development for the well-being of African peoples. We reaffirm that the Kilimanjaro Programme of Action for African Population and Self-reliant Development remains a valid framework for the development of the region. We have taken note of the Amsterdam Declaration on a Better Life for Future Generations; United Nations General Assembly resolution 45/216 on population and development; the United Nations New Agenda for the Development of Africa in the 1990s (UN-NADAF); Agenda 21 and the Rio Declaration on Environment and Development, as adopted by
the United Nations Conference on Environment and Development (UNCED); 
the deliberations of the ECA Conference of Ministers at its eighteenth meet-
ing; as well as preparations for the International Conference on Population 

We are conscious of the social, economic and political difficulties faced 
by most African countries since the early 1980s, the widening North/South 
gap, the insufficiency of available resources for implementing national popu-
lation programmes and the unfavourable outlook of the world economy.

We assert the prime responsibility of African Governments to improve 
the quality of life of the African peoples and to redress their economic and 
social situation. We are concerned about the persistent high population growth 
rate and associated high fertility levels; high infant, child and maternal mor-
tality levels; high morbidity and incidence of acquired immunodeficiency syn-
drome (AIDS); significant imbalance in the geographical distribution of the 
population in the region; inadequate policies for the improvement of the legal 
status of women in the family and its integration into the development 
process; ineffective programmes for children and young people; problems of 
refugees and displaced persons; and inadequate information systems and low 
level of data utilization. We recognize the need for an increased role of the 
public and private sectors as well as non-governmental organizations in popu-
lation and integrated development programmes.

We are mindful of the fact that the family is the basic unit in society and, 
as such, needs and is entitled to support and protection by society and the 
State in order to play its role in development.

We have further noted that despite the increased number of explicit pop-
ulation policies formulated, the implementation rate of the Kilimanjaro Pro-
gramme of Action remains low.

We have also noted that in spite of the efforts made by African Govern-
ments to reduce mortality, morbidity and infant mortality to the extent that the 
regional life expectancy at birth has risen from 49 years in 1984 to 51 years in 
1992, fertility and mortality levels remain high in most countries. We consider 
that this situation is worsened by rural-urban drift. We consider also that there 
are problems with empowering women to play an effective role in develop-
ment, in implementing programmes designed to promote children and young 
people and, in particular, to remove the causes of unequal treatment of young 
girls. We have noted the need to provide adequate data and information for the 
formulation of population policies, to broaden and deepen the role of non-
governmental organizations and to put in place national focal points to assist 
in the integration of population factors in the development planning process.

We recognize that population matters are an integral part of the socio-
economic development process and as such should be accorded high priority 
in the allocation of financial resources.
Now, whereas,

(a) African countries affirm their solidarity in dealing with population problems and undertake to formulate population policies respecting the sovereign rights of each country, along with the freedom, dignity and intrinsic values of their peoples, and, taking into account the relevant moral and cultural factors, to bear responsibility for reaffirming the rights and obligations of individuals and couples,

(b) The successful pursuit of any population policy requires the institution of a stable political and social environment and calls for the elimination of all forms of extremism that breed conflict and instability,

(c) The family, as an essential component of the economic and social fabric, requires the pursuit of appropriate strategies, adapted to family services, which should, themselves, form an integral part of population and development policies addressing the needs of all members, especially adolescents,

(d) In recognition of the critical roles of women in family formation and their major contribution to social and economic development, the rights, status and needs of women, particularly in the areas of education, employment and health-care services, should be explicit in all national development planning,

(e) The countries and peoples of Africa have experienced prolonged periods of economic and social hardships since the adoption in 1984 of the Kilimanjaro Programme of Action, stemming from natural and man-made causes such as: rising poverty level; problems of refugees and displaced persons; internal and international migration; environmental deterioration; natural disasters; growing debt burdens; declining economic trade opportunities; HIV/AIDS; and food shortages,

(f) The formulation and implementation of comprehensive population policies reflecting the realities of each country should be accelerated simultaneously with sustained economic growth to assure the achievement of long-term objectives of food security and sustainable development,

(g) The provision of training and research (in population and development) is an essential ingredient to effective integration of population factors in development planning,

(h) The success of national and regional efforts in the field of population and development depends to a large extent on a conducive, supportive international economic environment,

We hereby declare that African Governments should act upon the recommendations contained below.
RECOMMENDATIONS

Population, sustained economic growth and sustainable development

**Recommendation 1.** Population policies and programmes should be integrated into development strategies, focusing on strengthening of social sectors with a view to influencing human development and working towards the solution of population problems by setting quantified national objectives for the reduction of population growth with the aim of bringing down the regional natural growth rate from 3.0 to 2.5 per cent by the year 2000 and 2 per cent by the year 2010.

**Recommendation 2.** Measures should be implemented to tackle the underlying causes of environmental degradation such as poverty, focusing on environmentally sound and appropriate technologies, and to enhance the quality of the environment by reversing deforestation and soil erosion, checking the spread of deserts and adopting priority programmes aimed at management of water resources, with a view to reducing the impact of recurrent droughts and the resultant food shortages.

**Recommendation 3.** Greater emphasis should be placed on such matters as food security, marketing services, appropriate agricultural mechanization, research and extension services, more efficient use of land and farming systems, livestock development and assistance programmes to small farmers.

**Recommendation 4.** Industrial strategies should be strengthened at the country level so as to encourage economic growth.

**Recommendation 5.** Experiences in population policy and programme formulation should be exchanged and national and subnational institutions in charge of their implementation strengthened.

Family

**Recommendation 6.** The rights and responsibilities of all family members should be taken into account to ensure that measures protecting the family from socio-economic distress and disintegration may be taken in accordance with family well-being and health requirements, bearing in mind the survival strategies designed by the families themselves; also, couples and individuals should be provided with the facilities and resources for deciding the size of their families.

**Recommendation 7.** Family concerns should be integrated into all development plans, policies and programmes and analytical studies encouraged on demographic processes within the family cycle so as to better identify the determinants of small family size.

Fertility and family planning

**Recommendation 8.** A socio-economic climate and sustained political will should be created conducive to the pursuit of such effective fertility policies as make for: setting fertility and family planning (FP) targets for all people of reproductive age, while taking measures to reduce infertility where needed; implementing legal measures to improve the status of women and
their reproductive health; establishing strong maternal and child health (MCH) programmes; ensuring strong management and close collaboration between private and public sectors and communities in the implementation of their MCH and national FP programmes; decentralizing health-care delivery systems for urban and rural areas; strengthening information, education and communication (IEC) in MCH and FP programmes; strengthening family institutions; addressing unmet family planning needs of adolescents and others; and promoting the education of men and women on joint responsible parenthood.

**Recommendation 9.** Steps should be taken to ensure the availability and promote the use of all tested available contraceptive and fertility regulation methods, including traditional and natural family planning methods, ensuring choice of methods, with a view to doubling the regional contraceptive prevalence rate (CPR) from about 10 to about 20 per cent by the year 2000 and 40 per cent by the year 2010.

**Recommendation 10.** The possibility of production of contraceptives within the region should be studied.

**Recommendation 11.** National research should be promoted in human reproduction and capabilities increased through collaboration with the World Health Organization (WHO) programme of research, development and training in human reproduction (RDTHR) and other internationally recognized research organizations.

**Mortality, morbidity and AIDS**

**Recommendation 12.** Priority should be given to combating infant, child and maternal morbidity and mortality by giving special attention to primary health-care programmes as an integral part of preventive health policies, such as health education in school curricula at all levels and non-conventional education; enacting legislation to promote clean environment in rural and urban areas; launching national campaigns to increase availability of safe water and sanitation; increasing support to nutrition programmes and giving priority to vulnerable groups for food accessibility in areas of shortage.

**Recommendation 13.** Programmes should be established and strengthened to combat the spread of AIDS and health problems as part of the overall health programmes, with special focus given to high-risk groups.

**Recommendation 14.** By the year 2000, the region as a whole should aim at a life expectancy at birth of at least 55 years, an infant mortality rate of less than 50 per 1,000 live births, and a childhood mortality rate of 70 or less; and programmes should be developed and implemented aimed at reducing maternal mortality by at least 50 per cent from the 1990 level. Such programmes should include quality family planning services and studies in order to reduce the increasing problem of unsafe abortion, estimated to cause 30-50 per cent of maternal mortality in parts of Africa.

**Recommendation 15.** Health programmes should be implemented, such as the African Health Development Framework (AHDF), which was adopted by member States of WHO/Africa region in 1985.
Urbanization, migration and physical planning

Recommendation 16. Urbanization and migration issues should be addressed from a comprehensive integrated perspective, taking into account the underlying causes and impact, whether of demographic, social or economic nature; greater emphasis should be placed on regional development with the aim of achieving among the regions of the individual countries a more equitable distribution of all development efforts, as well as a better distribution of their population; management of cities and urban areas should be improved and rural development programmes intensified in order to lessen the pressure to out-migrate to the cities; an assessment should be made of urban policies, taking account of the relative role of net migration and natural increase in urban population growth.

Recommendation 17. In view of the importance of migratory flows of the African population within Africa and between Africa and other continents, a common position should be adopted by the countries concerned, within the framework of international conventions, regarding appropriate measures to be taken to protect people’s rights and guarantee their security.

Refugees and displaced persons

Recommendation 18. Every effort should be made to tackle the acute problems of refugees and displaced persons by setting up an integrated plan capable of dealing with the root causes and foreseeing solutions for the immediate, medium and long term.

Recommendation 19. Appropriate measures should be taken to protect and assist refugees in terms of paragraph 43 of the Kilimanjaro Programme of Action.

Recommendation 20. Policy makers should ensure that priority is given to the elimination of the underlying causes of the refugee situation through negotiation, conflict resolution, democratization and respect for human rights; that refugees and returnees are included in population-oriented development plans; and that the policy of voluntary repatriation should be integrated in development plans.

Recommendation 21. Refugees and displaced persons should be provided with adequate services as they enter the country of asylum and at the point of their voluntary repatriation, with the support of the international community.

Women in development

Recommendation 22. A national policy should be adopted on improving the role, status and participation of women, taking into account mainstreaming as a means of incorporating women’s programmes into all aspects of development, and its implementation should be monitored at the highest government level in accordance with the Abuja Declaration of Participatory Development: the Role of African Women in Development during the 1990s and Beyond; necessary steps should be taken to eliminate discrimination against women, as well as certain traditional and cultural practices and reli-
gious extremism which inhibit the effective advancement and participation of women in development.

Recommen dation 23. Programmes should be instituted and strengthened for reforming the educational system and vocational training with a view to providing basic education to all those at school age, with particular emphasis on the education of girls.

Recommendation 24. Programmes should be established and measures taken to:

(a) Pass legislation to enhance the legal status of women within the family and the community with a view to enabling women to contribute more directly in decision-making and in the formulation of strategies aimed at upholding family values, providing support to family members and contributing to stability in society;

(b) Formulate national policies and initiate measures aimed at ensuring greater participation and assumption of responsibilities by men in the maintenance and nurturing of their families, while enacting national legislation that will emphasize the complementary and equal partnership roles that men and women have to play in development;

(c) Recognize the participation of women in all production sectors, particularly in agriculture, and provide for them appropriate technology to reduce their workload, maximize their efficiency and effectiveness, and afford them better access to credit facilities and farm inputs with a view to enhancing their economic independence and improving the quality of life.

Children

Youth

Recommendation 26. Population programmes should provide education, counselling and other support services for young people and promote their participation in all development activities.

Recommendation 27. National policies should be formulated aimed at protecting youth from any form of abuse, economic exploitation, especially child labour, as well as other policies and programmes aimed at curbing drug abuse and alcoholism.

Recommendation 28. A comprehensive strategy on youth should be adopted encompassing (a) development and implementation of policies for young people, as well as educational, cultural and vocational training programmes; (b) strengthening MCH and FP services; (c) improving the role and status and participation of youth in society; (d) providing employment opportunities for young people; and (e) involving young people in the activities of youth-related non-governmental organizations.
Data collection and analysis, information dissemination, training and research

Recommendation 29. Determined and sustained efforts should be made to improve population and demographic data, including the establishment of civil registration and vital statistics systems, ensuring the cost-effectiveness of censuses without necessarily compromising data quality, and encouraging intercensal socio-demographic sample surveys to be undertaken.

Recommendation 30. Qualitative studies should be carried out to assess the impact of population programmes on the family.

Recommendation 31. Training and research in population and development in African universities and research institutes should be coordinated and the findings, together with their implications, effectively disseminated and brought to the attention of all concerned.

Recommendation 32. Regional institutes should be strengthened and cooperation enhanced among African countries in the area of training, research and data collection.

Recommendation 33. Studies should be carried out on the complex interrelationships between population, environment and sustainable development in order to assist African Governments to formulate and implement relevant policies.

Recommendation 34. National focal points should be put in place and strengthened for collating and disseminating population and development information on the basis of gender, together with the provision of adequate resources.

Information, education and communication

Recommendation 35. IEC programmes should be developed that involve recipients as partners and are research-based (including baseline studies), specifically targeted, culturally appropriate, rooted in local languages as far as possible and linked with follow-up activities, including the delivery of family planning services.

Recommendation 36. Strong IEC strategies and follow-up studies should be implemented to ensure greater involvement of and access to the mass media in IEC, and studies undertaken on constraints to African media organizations. Managers and professionals should be trained in the interpretation and use of population information.

Recommendation 37. Private and non-governmental organizations should:

(a) Promote community participation and involve communities in programme planning, implementation and financing; enhance collaboration and coordination with multilateral and bilateral organizations, and other organizations and government agencies;

(b) Be strengthened and considered full partners by Governments in the implementation of population programmes and in contributing towards the
formulation of related policies. They should also be involved in large-scale replication of successful innovative pilot programmes;

(c) Promote popular participation in population-related issues including environmental protection, attitudinal change, health and education.

Recommendation 38. The subregional and regional groupings should:

(a) Play their role in population-related matters by supporting policies that ease, *inter alia*, population movements particularly of women, and movement of goods, through flexible migration laws facilitating the voluntary redistribution of population and amelioration of economic conditions through intraregional trade;

(b) Promote technical cooperation, including the implementation of joint subregional programmes in the field of research, training and environmental protection.

Recommendation 39. ECA, UNFPA, the World Bank and other relevant organizations of the United Nations system, as well as such regional organizations as the Organization of African Unity (OAU) and the African Development Bank (ADB) should undertake all possible measures to implement, within their respective mandates, the recommendations of this Conference, including, where appropriate, joint activities.

Recommendation 40. The international community should:

(a) Continue to increase its assistance to African countries in the fields of population and development, long-term-perspective development planning, including that related to refugees and returnees, training and research; strengthen and expand support to all types and levels of training (in population and development) and help to strengthen the institution-building capacity of African countries; and establish technical structures to support programmes taking into account problems related to liaison and communication;

(b) Consider conversion of African debt into grants to be used in financing social programmes, including population activities;

(c) Strengthen South/South cooperation with regard to training, exchange of information, sharing of experiences, know-how and technical expertise.

RESOURCE MOBILIZATION

In this endeavour, we strongly appeal to the African Governments to ensure that adequate planning and budget appropriations are devoted to national population and socio-economic development programmes that further their objectives and make selective use of fees and other forms of cost-recovery, cost-sharing and accessing local resources of philanthropy to generate domestic resources to support service delivery programmes and provision of contraceptives, as well as traditional fertility regulation and natural family planning methods.

We also appeal to donors to respond positively and increasingly to requests for population assistance and activities and improve their coordination of such assistance with other bilateral and multilateral donors to ensure
that the population needs and requirements of African countries are properly addressed out of the 4 per cent target of official development assistance (ODA) to be devoted to population programmes to achieve the goals of the Amsterdam Declaration.

We appeal to UNFPA to consider Africa as a priority region and accordingly increase the resources allocated to the development of population policies and programmes.

FOLLOW-UP AND IMPLEMENTATION MECHANISM

In adopting this Declaration, we, the African Governments participating in the Third African Population Conference, hereby express our full commitment to implementing the aforesaid recommendations and, in this context, urge all member States and all concerned institutions to establish appropriate joint follow-up and evaluation mechanisms.

Considering the importance of a follow-up mechanism for the implementation of this Declaration, we recommend that ECA regional multidisciplinary expertise be reinforced to monitor and evaluate its implementation.

We express our profound appreciation to the Government and the people of Senegal, especially His Excellency Abdou Diouf, President of the Republic of Senegal, Chairman both of the Organization of African Unity and the Organization of the Islamic Conference, who has consistently been at the forefront of economic cooperation among African countries and North/South cooperation. We are most grateful for having had the occasion to hold this historic meeting of our Conference in this beautiful city of Dakar under the most conducive atmosphere of cordiality and warm hospitality.

NOTE

1 Paragraph 43 stipulates: Governments should take appropriate measures to protect and assist international migrants and refugees and safeguard their property and respect their culture.
EUROPEAN POPULATION CONFERENCE

The European Population Conference, jointly convened by the Economic Commission for Europe (ECE), the Council of Europe and the United Nations Population Fund (UNFPA), was held in Geneva from 23 to 26 March 1993. It involved countries in Europe and North America. The principal themes of the Conference were: international migration; fertility and the family; health and mortality; selected consequences of population growth and age structure; and international cooperation in the field of population. The Conference adopted the recommendations set out below.

RECOMMENDATIONS OF THE EUROPEAN POPULATION CONFERENCE

BACKGROUND

In the history of the development of the world population the decade straddling the end of the twentieth century will be decisive. Long-term population trends will depend, among other things, on measures and policies introduced during that decade. There is, therefore, an urgent need for politicians and policy makers at the global, regional and national levels to come to grips with the serious demographic challenges faced and to influence fundamentally the future course of events.

The nature of those challenges varies widely. At the global level, the expected tremendous increase in population numbers—the world population will grow from 5.3 billion to over 8 billion between 1990 and 2020—has driven home the fact that population and the environment are highly interdependent and that continued population growth, combined with unsustainable modes of production and consumption leading to environmental degradation through air, soil and water pollution, threatens the very basis on which life depends. It has also led to the realization that the future of countries is inextricably linked and that this interdependence necessitates international cooperation and solidarity among the different regions of the world.

For the developing countries, where over 90 per cent of the future world population growth will take place, the challenge is to generate adequate levels of sustainable economic and social development notwithstanding high levels of population growth, and to devote sufficient resources to population and development programmes to enable those countries to move towards their own demographic transition. Considerable progress has been made along this path, but in many developing countries no substantial decline of fertility has yet taken place. Entire regions are still experiencing higher levels of fertility than they consider desirable and have such a young age structure that they find
it difficult, if not impossible, to feed, educate and train the coming generations and to provide them with gainful employment.

In most of the developed countries the situation is entirely different. They have experienced a sustained period of low, at times unprecedented, levels of fertility. In many instances, these countries are still evaluating the implications of long-term population decline. At the same time the population is ageing rapidly. Also, Europe is now a region of destination of international migration.

A very particular challenge for the region results from the developments taking place in the countries undergoing political and economic transition. The revival of old national and ethnic rivalries not only facilitates the emergence of armed conflict and serious political crises, but also exacerbates demographic problems. Moreover, countries in transition face the formidable task of having to catch up with the almost uninterrupted social and economic progress experienced elsewhere in Europe in order to offer their populations better standards of living, a less polluted environment and a life free from armed conflict. For Europe as a whole, the existence of this group of countries in transition also poses a challenge which taxes to the limit the solidarity and inventiveness of all Governments of the region. It also makes Europe’s demographic situation very complex.

With due consideration to the most pressing issues both at the global and regional levels, priority areas were selected for discussion during this Conference of the European and North American region, herein referred to as “the region”. These were: (a) fertility, status of women and the family; (b) health and mortality; (c) population growth and structure; (d) international migration; (e) international cooperation; and (f) generation of policy-relevant knowledge. These areas have strong interrelations, a fact which will be taken into account in the recommendations of this Conference.

The past few decades have been marked by important changes in the societal context of fertility, status of women and the family. Fertility has declined unexpectedly and dramatically, and continues to be well below the level necessary for the replacement of generations. Even though in a few countries slight increases have been observed recently, the general expectation must be that, at least for the immediate future, substantial increases are unlikely as couples do not seem to desire larger families. Fertility regulation is now widely practised in the region. In many countries, however, individuals and couples have no access to or make insufficient use of appropriate methods of fertility regulation. High rates of unintended pregnancy and abortion attest to this problem, notably in eastern Europe.

An ever-increasing number of women are trying to achieve personal fulfilment both in their family and professional lives. A great challenge facing society is to create conditions enabling men and women to combine parental and work roles in a responsible manner.

New types of family arrangements have emerged, such as non-married cohabiting couples and single-parent families; as a result the number of children born from these unions is increasing. Even in areas where this situation does not prevail as yet, such phenomena may soon appear. Clearly the great
challenges facing society are to accommodate these pluralistic family forms in all aspects of society.

The improvements in health promotion, disease prevention and treatments and their effects on morbidity and mortality levels and trends in most western countries of the region have been very significant and further gains may be expected. Following rapid success in the fight against infectious diseases, advances have also been made in reducing mortality from cardiovascular diseases and, to some extent, from cancer. The implications of this favourable development are, among others, an increase in chronic and degenerative diseases. General welfare development and the considerable expansion of health services have both contributed to health improvements, as has the increased awareness in the population that has modified personal behaviour with regard to eating, drinking and smoking.

At the same time, new problems have arisen and old problems have become more acute. The acquired immunodeficiency syndrome (AIDS) pandemic and drug abuse, particularly among the young, are causes for concern, as is the link between environmental degradation and its influence on health and mortality. In many countries of the region there is also the important issue of increasing the availability of quality health care and the financing of health services. This is a particular concern for the countries in transition. Disparities in various demographic indicators, such as maternal and infant mortality and life expectancy, between western and eastern Europe suggest the need for improved health care, including reproductive health services.

The continued low levels of fertility and declining mortality at higher ages have direct consequences for population growth and the age structure of the countries in the region. In spite of the diversity that still exists, both at the macrolevel and the microlevel, there are closely convergent demographic trends, such as those towards very low or negative levels of population growth and ageing. These trends have important socio-economic and political implications. The aged population constitutes a valuable and important component of a society’s human resources. In many countries “ageing policies” are being developed to enable societies to adjust to changes in the composition and size of the labour force. The development of specific “ageing policies” is all the more important since the already high expenditure for health and retirement benefits is likely to increase with ageing. It should be realized that the issue of ageing is complex and is a challenge to those societies in which longevity has been increasing for some time. This achievement leads to new developments in the nature of the social contract which binds generations together.

With regard to international migration, it was noted that, whatever their inclination, most European countries had, as in the case of the United States of America and Canada, a considerable net influx of migrants. Because of worldwide economic and social disparities and political conflicts, the region will have to deal with long-term migration pressures from other parts of the world. Obviously the most crucial questions to be faced are how to control and manage the migratory flows to and within Europe in a humane and effective way and how to achieve a desirable level of integration. Apart from family migration, which is, or is becoming, the largest flow of legal migration, two other
categories of migrants have emerged pre-eminently on both sides of the Atlantic: asylum-seekers and irregular migrants. Asylum procedures are being increasingly used not only by genuine refugees but also by migrants whose motivation is economic. It is also important to keep in mind that while western Europe, through the European Community and its cooperation with the countries of the European Free Trade Association, is basically committed to the free movement of people within its area, this "openness" is difficult to achieve or maintain. There is a clear need for increased cooperation within Europe in the field of international migration. It is in the interest of both the sending and the receiving countries to see that ways are found to ameliorate the short-term crises and the long-term deprivation which lead to uncontrolled migration flows. Furthermore, countries in transition may be both generating and hosting substantial flows of migrants in the coming years.

*International cooperation* already exists among the countries of Europe and North America and the developing countries, as well as within the region. A major challenge is to continue to support the developing countries in their developmental and population programmes while at the same time intensifying similar activities with the countries in transition. The imbalance between population dynamics and economic and social development, and its perceived impact at the world level on the environment, have contributed to increasing awareness of the complex interdependency between different regions of the world.

**PREAMBLE**

*Considering* resolution 1991/93 of the Economic and Social Council inviting the regional commissions of the United Nations to organize, in preparation for the International Conference on Population and Development in 1994, regional conferences to review the experiences gained in population policies and programmes in their regions, bearing in mind the relationship between such policies and programmes and development issues, and to propose further action;

*Considering also* decision G (40) of the Economic Commission for Europe, which requested the Executive Secretary to collaborate with the United Nations Population Fund in convening periodically a regional meeting of experts on population for consultations among Governments and for the dissemination and exchange of information on population problems and policies in the ECE region;

*Considering further* the decision of the Ministers’ Deputies of the Council of Europe at their 470th meeting to convene the present Conference jointly with the United Nations Economic Commission for Europe and the United Nations Population Fund;

*Aware* of the political changes that have occurred recently in Europe and of their positive impact on the development of cooperation between all countries of the region;
Mindful that despite the diversities of their socio-economic, political, cultural, demographic and environmental conditions, the countries of the region share important common concerns in regard to population;

Aware of the specific needs of the countries in transition in the field of population, particularly in the context of the economic reforms under way there;

Mindful also that the developed and the developing counties in the perspective of sustainable development share common ground and interest on population matters, and are desirous to cooperate in this area;

Noting also the relevance of the 1989 Amsterdam Declaration on a Better Life for Future Generations;

Reaffirming that population policies, including migration policies, should be consistent with and observe the Universal Declaration of Human Rights (1948), the International Covenants on Civil and Political Rights and Optional Protocol, and on Economic, Social and Cultural Rights (1966), the European Convention for the Protection of Human Rights and Fundamental Freedoms (1950) and its additional protocols, the United Nations Convention on the Elimination of All Forms of Discrimination against Women (1979), the Convention (1951) and the Protocol (1967) relating to the status of refugees and similar international instruments;

Conscious of the principle of equity in health and the policy targets as stated in the Strategy for Health for All by the Year 2000 of the World Health Organization and of the European Charter on Environment and Health, Frankfurt, 1989;

Stressing the importance of the activities initiated in the context of the Conference on Security and Cooperation in Europe which contribute to the observance of human rights, to conflict prevention and to the improvement of living conditions of the population of the countries concerned;

Reaffirming the outcomes of the United Nations Conference on Environment and Development (UNCED) held at Rio de Janeiro in June 1992, and the commitment demonstrated by that Conference that all concerns of sustainable development, including those related directly to population, should be addressed in a fully integrated manner;

Recognizing with appreciation the valuable role that the international governmental organizations, including the Council of Europe and United Nations organizations, and non-governmental organizations have played and can play in promoting greater awareness of the nature of population problems and the need for effective action;

Reviewing recent population trends and policies, and future prospects of demographic development in the region, as described in the documents submitted to the Conference and summed up in the introduction above;
Adopts the recommendations contained below and requests the Executive Secretary of the United Nations Economic Commission for Europe to transmit these recommendations to the Preparatory Committee of the International Conference on Population and Development.

RECOMMENDATIONS FOR ACTION

Recommendation 1. Recognizing that sustainable development on the global scale is a common responsibility to be shared by the Governments of the region and those of the developing countries, the former should actively participate in all necessary joint efforts to be undertaken in this respect. Governments of the region should, in particular, be aware that poverty, population growth and environmental degradation are closely interrelated. While population growth and poverty result in certain kinds of environmental stress, the major causes of the continued deterioration of the global environment are the unsustainable patterns of consumption and production, particularly in industrialized countries. Common targets should be the promotion of patterns of consumption and production that reduce environmental stress, and the encouragement of social and economic development that meets basic needs and allows for better living conditions and appropriate fertility rates.

Recommendation 2. Population-related activities touching upon the most personal sphere of life should, as a prerequisite, be implemented in accordance with human and fundamental rights. They should in particular contribute to the improvement of the role and status of women, the reduction of large discrepancies in living standards and the peaceful settlement of religious, ethnic, political and economic conflicts.

Fertility, status of women and the family

Socio-economic support to the family and gender equality

Recommendation 3. A more child-friendly and family-friendly environment should be promoted in all spheres of society, such as housing, child-care programmes, working conditions, time schedules and recreational facilities.

Recommendation 4. Governments, in cooperation with the private sector and the social partners, should help the ever-increasing number of parents who desire to achieve fulfilment through both professional life and parental roles. They could contribute to making those two goals compatible by developing and strengthening social services such as child minders, crèches, kindergartens and parental leave. In addition, they should encourage other measures to facilitate work outside the family by either parent, such as part-time activity and flexible schedules. Particular attention should be given to the needs of women, who still bear a disproportionate burden of the responsibility in the family, by introducing measures which encourage men to share those responsibilities.

Recommendation 5. Governments and private organizations, as appropriate, should consider measures which compensate, at least partially, for the
costs of child-bearing and child-rearing, particularly for those with limited resources. These measures may include direct financial and other support, tax incentives, and low-cost or free child and maternal welfare services.

**Recommendation 6.** In order to develop better gender equality, Governments should promote conditions that further political, economic and social equality between men and women, including equal opportunities for education, training and employment, and equality in family responsibilities.

**Recommendation 7.** Governments and private organizations, as appropriate, are encouraged to develop more targeted programmes focusing on vulnerable groups of the population and families which bear special burdens. An objective is to address persistent and ever-growing poverty and low income among those sections of the population by such measures as income maintenance, job creation, housing support, free or subsidized training, and preferential child care.

**Reproductive rights, reproductive health and family planning**

**Recommendation 8.** In their social and family policies, Governments should adopt measures to enable individuals and couples to exercise their right to decide freely and responsibly the number and spacing of their children. These measures should increase the access of individuals and couples to education, information and the means of regulating their fertility, including the treatment of infertility, regardless of overall demographic goals. Counselling and quality family planning services should be provided and supported to reduce the number of induced abortions. In view of the current situation in countries in transition, Governments of those countries should strengthen their services in reproductive health, including family planning, and encourage non-governmental organizations in this field.

**Recommendation 9.** Although most countries are experiencing favourable trends towards the use of medically approved family planning methods, there are still groups that need particular attention. Governments should seek to increase access to appropriate information, family planning services and educational programmes for those groups.

**Recommendation 10.** Public authorities at national and local levels, non-governmental organizations and other institutions concerned should support non-coercive family planning services, which respect the values of recipients, together with maternal and child-health programmes and related reproductive health services. Family planning associations and other concerned non-governmental organizations should be involved in the design and implementation of those programmes and services. In promoting the development of family planning services, particular attention should be given to the quality of the services.

**Recommendation 11.** As new methods of medically-assisted reproduction and their use are developing rapidly, Governments should provide for mechanisms to examine the ethical dimensions of the application of those methods and their social, economic, legal and health consequences. International exchanges on these questions should be organized by the Council of Europe and other international organizations.
Health and mortality

Health promotion and personal behaviour

Recommendation 12. According to the targets of the WHO programme Health for All by the year 2000, Governments should encourage population participation in designing and executing health policies. This includes specific health and intersectoral policies affecting the health status of the population, including those collaborative international efforts to prevent and control HIV/AIDS. In particular, community participation in primary care, long-term care for the elderly and/or disabled, and local initiatives concerning the promotion of health for all should be reinforced. Different forms of self-care based on recent knowledge and information should be developed.

Recommendation 13. Governments should consider health promotion a principal strategy for improving health and prolonging a healthy life. Health promotion consists of the following: (a) the transmission of knowledge regarding disease prevention and health-maintaining behaviour to the general public as well as to specific risk groups, such as teenagers; (b) the internalizing and application of knowledge by the respective target groups, resulting in changes in personal behaviour, such as ceasing to smoke, lower or no consumption of alcohol and drugs, eating a more balanced diet, more responsible driving behaviour, performing physical exercises and practising safe sex. Governments should also consider education programmes as well as taxes and other financial mechanisms to discourage the excessive use of substances such as tobacco and alcohol, and the abuse of psycho-active drugs. The needed infrastructure should be provided by Governments, by the private sector and by communities.

Health and the environment

Recommendation 14. Governments, in collaboration with the private sector, should recognize the link between the commitment to policies that lead to ecologically sustainable development, the prevention and control of risks, and equitable access to a healthy environment, as stated in the European Charter on Environment and Health, in the UNCED recommendations and in WHO documents. This includes, among other things, ensuring water and air quality, food quality and safety, waste management, chemical safety, health of people at work, safe housing and supportive environments for each generation. An initial indispensable step consists of monitoring air, water and soil pollution and its impact on the health of human beings, particularly of vulnerable groups, such as children, the elderly and workers at risk.

Recommendation 15. Governments should identify and monitor the causes of socio-economic and regional mortality and morbidity differentials, and subsequently make efforts to reduce them.

Health of women and children

Recommendation 16. Governments should ensure that families, and in particular women and children, have access to a full range of appropriate, quality health services and programmes. This includes family planning and
reproductive health services entailing preconceptual, prenatal and postnatal care. Such services should be accessible to all women and also contribute to reducing infant and maternal mortality and morbidity and promote healthy birth outcomes and healthy development of children, now and in the future, in keeping with the goals of the declaration and plan of action adopted at the World Summit for Children, 1990.

Recommen dation 17. Particular attention should be given to the protection of pregnant women and to breast-feeding mothers at the workplace.

Healthy ageing

Recommendation 18. Governments should provide and promote appropriate services, care and support to elderly people in need, implement strategies to increase the number of disability-free years and improve their quality of life.

Health systems

Recommendation 19. Governments are urged to reform health systems so as to increase their cost-effectiveness and efficiency and to improve their responsiveness to the needs of the respective populations. The need for reform of the health system is particularly obvious in countries in transition, where recent changes have not only exposed the extent of the health crisis but also have further exacerbated the crisis due to the austerity measures necessary to implement the transition to a market economy.

Recommendation 20. Governments, as well as private and public organizations concerned, should make every effort to maintain an adequate level of medical and social protection for disadvantaged groups in the light of financial difficulties faced by social security systems and the lack of health insurance coverage of various groups, which, together with persistently high levels of unemployment, entail inadequate medical protection for parts of the population.

Health personnel

Recommendation 21. In the formulation and implementation of their health policies, Governments should pay attention to the problem of insufficient availability of qualified personnel in certain categories of health personnel (e.g., nurses). They are therefore invited to consider adjusting training curricula and facilities. They should encourage adapting working conditions and improving social status and salaries accordingly. Governments should also ensure that women have an important role in decision-making for health.

Population growth and age structure: selected consequences

Population growth and age structure

Recommendation 22. In their economic and social policies, Governments should take into account the consequences of the fluctuating numbers of population in different age groups resulting from past demographic changes. Knowledge of demographic trends should be given due considera-
tion by policy makers. These policies should focus on the effects of population fluctuations on the educational system, the labour market, and on social and health services for the elderly. Governments and policy makers should ensure that short-term policies work in conjunction with long-term policies to address the consequences of population ageing.

**Recommendation 23.** Governments should appreciate that, while certain imbalances in the labour market may be compensated for by immigration, immigration may not be a full solution for the adjustment of the age structure. Heavy reliance on immigration to solve demographic imbalances could in the long run lead to substantial fluctuations in the age structures of national populations.

**Socio-economic consequences of ageing**

**Recommendation 24.** Governments should give high priority to the development of human resources as a way of dealing with the adverse effects of population ageing. Suitable measures should include the training of both young and adult persons, and incentives for a better use of the older members of the labour force and of those retirees able and willing to remain economically active. The valuable contribution that the elderly make to society, especially as volunteers and caregivers, should be given due recognition.

**Recommendation 25.** Governments should seek to enhance the self-reliance of the elderly and to facilitate their continued participation in society. Governments should ensure that the necessary conditions are created to enable elderly people to lead self-determined lives and to make full use of the skills and abilities they have acquired in their lives for the benefit of society.

**Recommendation 26.** Governments should consider, as appropriate, social security system reforms to ensure greater intergenerational and intragenerational equity and solidarity. Such reforms should also deal with the potential imbalances between revenues and expenditures in the pension programme. Those no longer capable of working should be assured reasonable benefits, irrespective of age.

**Resources for the care of the elderly**

**Recommendation 27.** Policies should stimulate different forms of care for older populations, which will increase substantially in numbers, especially in the highest age brackets. Special efforts should be made to enable older persons to remain in their homes and communities, as far as possible, by providing greater home and community health care and social services, improving coordination of community services, expanding rehabilitation programmes, and giving financial and other incentives to assist families and individuals in taking care of the elderly. Governments should also elaborate policies to address the growing need for organized care in public and private sectors.

**Recommendation 28.** Governments should ensure adequate quantitative and qualitative recruitment of human resources to cope with the growing needs of the formal old-age care sector already faced with severe pressures on human resources. Governments, local authorities and organizations should implement measures to improve the status and working conditions of those
professional groups. In addition, the contribution of families and volunteers should be recognized and encouraged by all organizations concerned but should not be considered as a substitute for formal care.

**International migration**

*Recommendation 29.* Wider discussion of the economic, social, cultural and political implications of migration should be undertaken in order to elaborate or improve appropriate policies. Governments of sending and receiving countries should improve the dissemination of information and promote consultations with a view to reaching a broad national and international consensus on those questions.

*Recommendation 30.* Cooperation in the field of migration should also be considered in the context of economic, social and legal cooperation.

**Migration and development**

*Recommendation 31.* Governments of countries of origin and destination should seek to redress the causes of emigration in order to alleviate the massive and uncontrolled international migration flows. The redressing of those causes would require increased effort to achieve sustainable economic and social development, avoid international and internal conflicts, respect the rule of law, promote good governance, strengthen democracy, promote human rights, support education, nutrition, health and population-relevant programmes and ensure effective environmental protection. This may require financial assistance, reassessment of commercial and tariff relations and full access to world markets, and stepped-up efforts on the part of developing countries to create the framework for a market-oriented economy and a liberal trading system. The economic situation in those countries is likely to improve only gradually and, therefore, migration flows from those countries will decline only in the long term; in the interim, the acute problems currently observed will cause migration flows into the region. In addition, Governments of countries of destination should acknowledge the influence of economic "pull" factors on international migration.

*Recommendation 32.* Governments of countries of destination have the right to control access to their territory and adopt policies which shape immigration flows. Such measures should conform to universally recognized international standards. As movements of persons are part of the process of development of free societies and market economies, host countries should also adopt policies which allow legal migrants the option of remaining, either on a temporary or permanent basis.

*Recommendation 33.* Forms of temporary migration, such as short-term and project-related migration, might offer the Governments of the region an opportunity to improve the skills of nationals of developing countries and countries in transition; they should therefore be considered, if appropriate, in the national and regional context through both bilateral and multilateral inter-governmental agreements. Appropriate steps should be taken to safeguard the wages and working conditions of both migrants and nationals in the affected sectors.
Refugees and displaced persons

Recommendation 34. In view of their responsibilities under the United Nations Charter, and consistent with their obligations under the existing international instruments in the field of human rights, Governments should do everything in their power to avoid new massive flows of refugees and displaced persons. Accordingly, they should respect the rights of individuals belonging to minorities and refrain from creating or contributing, by their domestic policies, to causes and factors which generally lead to massive flows of refugees and involuntary migration. This implies, among other things, a condemnation of all kinds of “ethnic cleansing” whether it is the responsibility of Governments or local groups within a country.

Recommendation 35. Women and children comprise the overwhelming majority of the worldwide refugee population. Protection and assistance programmes can be effective only if they are planned and implemented with full recognition of the needs of women and children. The active involvement of refugee women in all stages of programme development and service delivery is essential.

Recommendation 36. Confirming their commitment to the relevant international instruments concerning protection of refugees, Governments should do their utmost to ensure protection and assistance to refugees and displaced persons, with the aim of finding durable solutions, and to support all efforts to this end. They should harmonize as far as possible their asylum policies and regulations in accordance with international instruments and in a way that does not add to the suffering already experienced by refugees and displaced persons. They recognize that solutions to the problem of refugees and displaced persons may best be achieved through a comprehensive approach.

Recommendation 37. In cases of sudden and massive arrivals of refugees and displaced persons in need of international protection, they should be accorded at least temporary protection and treatment in accordance with the national practices and regulations and internationally recognized humanitarian standards, until a solution is found. Governments should encourage persons in need of international protection to stay, to the extent possible, in the safe areas nearest to their countries of origin. Availability of aid and the strengthening of protection mechanisms in those areas should contribute to this objective, while at the same time building confidence among the persons concerned. The principles of collective cooperation and international solidarity should be applied in assisting host countries, if requested.

Recommendation 38. Governments and international organizations should support the voluntary repatriation of refugees and displaced persons as a durable solution.

Recommendation 39. Governments should apply fair, efficient, expeditious and reliable procedures to deal with asylum applicants.

Recommendation 40. Governments are urged to further promote coordination and consultation to prevent the misuse of humanitarian instruments which in the long run might negatively affect the right of asylum.
Illegal migration and illegal stay

Recommendation 41. Governments should aim to prevent uncontrolled influxes of migrants by making potential migrants aware of the legal conditions for entry, employment and stay in host countries through information activities in the countries of origin, making use of the facilities of international organizations where appropriate. Governments should also take action against traffickers and employers of illegal immigrants. For efforts to control migration, in particular illegal migration and illegal stay, to be successful, countries should devote appropriate financial, political and diplomatic resources to them.

Recommendation 42. Governments of countries of origin of illegal migrants and rejected asylum-seekers should not impede the re-entry and re-integration of those persons. In addition, Governments of countries of origin and destination should try to find satisfactory long-term solutions to the problems caused by illegal migration through multilateral and bilateral negotiations, for example by readmission agreements.

Recommendation 43. As a consequence of the irregularity of their situation, illegal immigrants are particularly vulnerable to all forms of exploitation and discrimination. Governments of receiving countries should ensure that their basic human rights are respected.

Integration

Recommendation 44. The social and economic integration of resident legal migrants, a common responsibility of the host society and the migrants themselves, should also be a major objective of government policy. Security of residence, especially after a number of years, is an essential condition for successful integration. Where legal immigration has proved to be of a long-term nature, naturalization should normally be available, especially for second-generation immigrants; civil and political rights and responsibilities should be extended to long-term legal immigrants, as appropriate.

Recommendation 45. It is a basic function of Governments to ensure the protection of all residents—including foreigners—against violence and the threat of violence. Governments should urgently develop strategies to combat racist or xenophobic violence and threatening behaviour, especially through information, education and the promotion of tolerance and understanding.

Recommendation 46. Public authorities at the national and local levels, the private sector and the non-governmental organizations should take into account the different national, ethnic and cultural origins of immigrants and show an open attitude towards their cultural, religious and other values, as long as these are compatible with the laws and fundamental values of the host societies. Equality of opportunity should, as far as possible, be granted to resident legal immigrants. At the same time, Governments as well as immigrants should recognize that action to enable resident legal immigrants to have access to education, training, employment and housing, and to achieve a high level of competence in the languages of host societies, in accordance with national legislation, are crucial to the success of integration strategies. In this
context, special efforts should be made in favour of migrant women, children and other vulnerable groups.

*International cooperation in the field of population*

**Recommendation 47.** The United Nations Conference on Environment and Development has highlighted the interaction between population, environment and sustainable development. An increasing number of countries are aware that rapid population growth imposes growing constraints on social and economic development, with negative effects in particular on the environment and on the natural resource base. To help solve those problems is also a challenge for the countries of the region that are States Members of the United Nations. Moreover, the political, social and economic transformations of historical importance, and the birth of the new democracies in the countries in transition, have created new possibilities for European cooperation. In recognizing that international cooperation, especially to support the efforts of countries with rapid population growth, is more urgent than ever, member States should seize the opportunity for closer cooperation within the region, as well as with the developing countries, that has been created by the end of the East-West conflict and the consensus on the elements of a global partnership for development. This cooperation in the field of population should be permanently based on respect for fundamental human rights and the responsible exercise of such rights for all individuals.

*Cooperation within the region*

**Recommendation 48.** Governments should, as a matter of urgency, assist countries in transition in the field of population issues. Key elements of such assistance should be financial support through bilateral and multilateral channels. Technical backstopping, training, exchange of information, experience and expertise should be used to strengthen data collection and research capabilities.

**Recommendation 49.** Governments and regional organizations, in collaboration with international organizations, should elaborate and implement a coordinated strategy to assist countries in transition in the field of reproductive health, including family planning, in the implementation of reforms in health systems, and in the field of migration.

**Recommendation 50.** Governments and organizations concerned should assist countries in transition to develop policies and implement integrated activities relating to health-population-environment issues.

*Cooperation with developing countries*

**Recommendation 51.** Cooperation with developing countries should be built upon a strengthened partnership based on the recognition of sovereign equality, mutual interest and shared responsibility with mutual commitments. While developing countries have a primary responsibility for their own economic and social development, including the formulation and implementation of appropriate national policies relating to population and development,
developed countries have a special responsibility to help create a favourable international economic environment and to increase the quantity and quality of their assistance, particularly in the field of population.

**Recommendation 52.** The rate of population growth is acknowledged to have a major influence on global prospects for economic and social development. A broad consensus has emerged on the complex interrelationships between poverty, population growth, human rights, environment and economic, social and human development. Even though fertility rates in many countries have decreased substantially, the high rate of population growth is still a fundamental problem in a large number of developing countries, adversely affecting individual health and welfare, national economic progress and employment, and the natural resource base; the rapid population growth is also putting strong pressure on health services, educational systems, social services and housing. Governments, regional institutions and non-governmental organizations of the region should give a high priority to cooperation with developing countries, supporting their efforts to achieve population growth rates and distributions which strike an optimal balance between their population, the natural resource base and the environment. Special attention should be given to the African region, where population-related problems are particularly serious. In doing so, Governments, regional institutions and non-governmental organizations should give high priority to population issues in their development assistance strategies, to help improve the quality of human resources and the status of women, to answer unmet demands for reproductive health and services, including family planning services, and to promote health in its various aspects. They should address these issues continuously in their policy dialogues with partner-countries, both at the bilateral and the multilateral levels.

**Recommendation 53.** There is already a large, and growing, unmet demand in developing countries for family planning services. UNFPA estimates that 300 million women worldwide would like to use family planning services but do not enjoy the fundamental human right of access to them, nor do they have the ability to plan freely and responsibly the number and spacing of their children. Efforts should thus be intensified to ensure the availability of family planning services to all who wish to make use of them. Such efforts can be expected to help in achieving population growth rates which contribute to a sustainable use of natural resources.

**The commitment**

**Recommendation 54.** Developing and developed countries alike should increase their political commitment to population-related programmes and policies, in accordance with their national priorities and goals and with due respect for fundamental human rights.

**Recommendation 55.** Governments, intergovernmental institutions and non-governmental organizations should commit themselves to working together to promote intersectoral collaboration and to coordinate their assistance to population activities with a view to maximizing the effective use of scarce resources, to avoid duplications and to make optimum use of the avail-
able expertise within the field. Coordination with the United Nations Population Fund, with other multilateral and bilateral donors, and with nongovernmental organizations is essential to ensure that the needs and requirements of developing countries are fully addressed.

**Basic principles of cooperation**

**Recommendation 56.** Population-related programmes and policies should be an integral part of national development strategies. Policies must be linked to programmes on primary health care (including efforts to combat infant mortality), literacy and education, enduring adequate food supplies, housing, employment and the sustainable use of natural resources. Particular importance is attached to gender perspectives, to the full involvement of both women and men in reproductive health programmes, and in the development process. The improvement of the status of women at all socio-economic and political levels, and the extent to which they are free to make responsible decisions affecting their lives and those of their families, including decisions on reproduction, should be promoted as crucial factors for women-and-child health-related issues and, consequently, for future population growth rates. Great weight should be attached to participatory development of population-related programmes and policies to ensure grass-roots acceptance and involvement.

**Recommendation 57.** Population-related programmes and policies must be based on the fundamental right of individuals and couples to make their own informed choices with regard to their sexual and reproductive health and behaviour and the health of their living and future children. Therefore no assistance or encouragement should be given to programmes which are in any way coercive, discriminatory or prejudicial to fundamental human rights. Design and implementation of population programmes should give due consideration to the ethical and cultural aspects as long as they respect fundamental human rights. Population-related programmes and policies should be based on the right of individuals to choose voluntarily the number and spacing of their children, supported by adequate information on reproductive health services, on the full range of family planning services, including the availability of contraceptive means and methods, and information on their advantages, effectiveness and safety.

**Recommendation 58.** Population programmes cannot be successfully implemented if women are not fully involved in all aspects of development and decision-making. This is closely dependent on legal rights, on the ability to exercise those rights and on achievements in the field of education, particularly with regard to women and young girls. Governments should take appropriate measures to develop or strengthen the legislative framework to ensure women's full participation in development and society. High priority should be given to universal literacy and education at all levels. Furthermore, population and family planning topics should be integrated into education programmes for the information and education of young people.
Objectives of cooperation

Recommendation 59. As objectives of cooperation Governments should:

(a) Assist countries in assessing the environmental and developmental implications of their population growth and movement;

(b) Enable countries and local communities to respond to and influence population growth and movement, with due respect to fundamental reproductive and human rights;

(c) Assist in promoting, developing and implementing appropriate national population-related programmes and policies as part of overall national plans for economically and environmentally sustainable development and poverty reduction.

Recommendation 60. As objectives of cooperation Governments should also:

(a) Enable women and men to freely exercise an informed and responsible choice concerning the number and spacing of their children;

(b) Assist in creating an environment in which this free choice can be fully exercised, particularly by improving access to and the quality of reproductive health services, including family planning.

Recommendation 61. Furthermore, Governments should also:

(a) Assist in providing access to information and education on population issues, including sexuality, reproduction and contraceptive methods, in schools and outside, including family and community-based programmes, for both men and women;

(b) Promote research on reproductive health issues as part of essential national health research programmes supported by the international community, and develop and improve methods of contraception in order to widen the choices available for voluntary family planning;

(c) Assist developing countries, where appropriate, to evaluate the quality and safety of contraceptive methods available.

Action

Recommendation 62. In order to achieve sustainable development and a higher quality of life for all, developing and developed countries alike should commit themselves to reducing and eliminating unsustainable patterns of production and consumption and to promoting appropriate policies on population and development. The goal of an optimal balance between population, production and consumption patterns, and resources is the common challenge binding all countries.

Recommendation 63. To achieve this balance, an increased investment of financial and human resources is required. Governments are encouraged to increase, on a regular basis, their financial commitment to population activities. Countries should consider the possibilities for the reduction of military expenditure, and for channelling the savings towards socially productive uses, including funding of development and related population activities. Governments, intergovernmental institutions and non-governmental organizations are
urged to consider a significant increase in their development assistance allocated for population activities. This increase corresponds to the appeal of the International Forum on Population in the Twenty-First Century which called on the donor community and the international organizations to mobilize additional resources by the year 2000 in favour of population programmes.

**Recommendation 64.** Governments participating in the European Population Conference should commit themselves to the promotion of the objectives and proposals on international cooperation outlined above through their full and active involvement in preparations for the International Conference on Population and Development and at the Conference itself.

*Generation and utilization of policy-relevant knowledge*

**Recommendation 65.** In the course of formulating and evaluating their population-related policies, Governments are urged to promote and make use of scientific knowledge on the multitude of determinants and consequences of population change. They are advised to allocate increased human and financial resources to the development of a national capability to: *(a)* collect and process population and related statistics; *(b)* conduct research into interrelations among population trends, economic development, social transformation and environmental change; and *(c)* make use of research findings in policy decision-making in the population field and related areas.

**Recommendation 66.** Governments are invited to coordinate, wherever appropriate, their data collection, research and related activities in cooperation with international and regional intergovernmental organizations.

*Data collection*

**Recommendation 67.** Governments are urged to encourage a more systematic use of existing sources of population statistics, such as population and housing censuses, civil registration systems and population registers, along with sources of related information, e.g., labour force and socio-demographic sample surveys. Countries lacking relevant statistical systems should be encouraged and assisted in the setting up of such systems. In order to greatly enhance policy-relevant population research, Governments and statistical agencies are urged to make depersonalized information at the individual and household levels readily accessible to population research organizations, subject to the appropriate confidentiality constraints.

**Recommendation 68.** National statistical organizations and demographic institutes are encouraged to periodically conduct nationwide specialized sample surveys in order to collect the information required to study the effects of the relevant factors, including policy measures, on demographic processes.

**Recommendation 69.** To enhance international comparability of population research findings, it is recommended that the relevant national data collection efforts, wherever appropriate, be properly coordinated by countries in the region, *inter alia*, by the development and application of international standards concerning concepts, classification and methods.
Research

Recommendation 70. To promote the utilization of policy-related knowledge in the formulation and evaluation of population policies and programmes, Governments are urged to support research, particularly in areas of special relevance to policy-making, such as those mentioned in recommendations 3 through 64 above.

Recommendation 71. In view of similarities in population issues faced by Governments of different countries of the region, national population institutes and related research organizations are urged to increasingly coordinate their research efforts, wherever appropriate, under the auspices of international and regional intergovernmental organizations or professional organizations.

Training, education and information

Recommendation 72. Governments, in particular those in transition countries, are urged to develop education and training programmes at undergraduate and graduate levels with a view to providing intermediate and advanced skills in data collection, analysis and research relevant to the formulation, implementation and evaluation of population-related policies and programmes. Governments in donor countries and international organizations are advised to assist developing countries and countries in transition, in training and improving the qualifications of population-related specialists.

Recommendation 73. Governments and international organizations should initiate and support population education and information programmes in order to promote awareness of population issues in the population in general and in specific groups such as politicians, policy makers, journalists and teachers, in particular.

Coordination by international organizations

Recommendation 74. International governmental and non-governmental organizations of the countries in the region engaged in the field of international, organized population-related research, data collection and statistics are urged to develop a cooperative programme in those fields that ensures a systematic comprehensive, international comparative monitoring and early-warning system of important population-related socio-economic developments within the whole region, while avoiding costly and inefficient duplication and overlapping.
ARAB POPULATION CONFERENCE

SECOND AMMAN DECLARATION ON POPULATION AND DEVELOPMENT IN THE ARAB WORLD

The Arab world is contributing to the common effort of the developing countries in the quest for a cultural renaissance, aimed at establishing the requirements of socio-economic development and enabling the Arab people to participate in the shaping of their destiny on their land, now and in the future, within a framework of justice, democracy and respect for community to achieve peace, progress and prosperity.

In their efforts to achieve those goals, the Arab world is experiencing socio-economic changes and facing challenges, problems and dangers which make it necessary to mobilize the efforts, capabilities and potential of Arab societies and to satisfy the basic needs of the population within the framework of development.

In this connection, the past decade witnessed a decline in oil revenues, on which the Arab world depends heavily, the outbreak of the Iran-Iraq War and the Gulf War, and continued tension in the region as a result of the failure to reach a just and comprehensive solution to the Arab-Israeli conflict. Furthermore, the external debt crisis was exacerbated in a large number of Arab countries, producing its own effects and pressures. In addition, the world economic recession of the past decade and the tendency to create large economic blocs have adversely affected the Arab countries, as indicated by the decline of Arab export prices, the problem of the trend towards protectionism, fluctuations in exchange and interest rates in international money markets, return migration and the decrease in private remittances.

The population question constitutes a primary factor with dimensions interlinked with the various challenges and dangers. During the past four decades, the Arab region has undergone tremendous demographic changes, the most significant of which was remarkable population growth. The population of the Arab world increased from about 132 million in 1974 to about 237 million in 1992, a figure expected to reach 449 million in 2020 (according to United Nations estimates). All this has led and will lead to increased resource and environmental challenges.

This rapid and continuous increase in the population has necessitated the formulation of the requisite plans and policies to meet needs in regard to employment opportunities, education, health, housing, food and public services. The region has also witnessed a huge movement of labour among its various countries and also to countries outside the region. Consequently, the population question was closely linked to the economic and social aspects of development issues and to the interrelationship between development require-
ments, on the one hand, and the environment and the outside world on the other.

In order to express the Arab point of view on the population question within the context of the interrelated developments concerned with economic, social, cultural and environmental affairs, the Arab Governments welcomed the International Conference on Population and Development, to be held in September 1994 at Cairo. In preparation for that Conference, the Arab Population Conference was convened at Amman, Jordan, from 4 to 8 April 1994. The Conference was jointly sponsored by the Economic and Social Commission for Western Asia (ESCWA), the League of Arab States and the United Nations Population Fund (UNFPA). The Conference included a three-day meeting of experts and senior officials, immediately followed by a two-day ministerial meeting. The senior officials meeting discussed papers dealing with population, environment and development; population growth and demographic structure; population distribution and internal migration; international migration; population and women; family planning, health and family well-being; and population policies and programmes.

For all the assistance and support rendered in regard to programmes, policies and projects in the field of population in the Arab world, the participants in the Conference extend their gratitude and appreciation to the Arab Governments, ESCWA, the League of Arab States, UNFPA, and all the international and regional bodies concerned with population issues. The participants also wish to express their gratitude and appreciation to the Government of the Hashemite Kingdom of Jordan for generously hosting the Arab Population Conference and for providing it with so much support and assistance.

On the basis of the principles, objectives and orientations that emerged at the Arab Population Conference with regard to population questions, the participating Arab delegations adopted the Second Amman Declaration on Population and Development in the Arab World.

PREAMBLE

The Arab Population Conference,

Adhering to the Charter of the League of Arab States and the Statutes of its specialized organizations and councils, as well as to the principles, objectives and policies set forth in pan-Arab and sectoral instruments and strategies,

Recalling the provisions of the Charter of Arab Economic Action adopted by the Arab kings and heads of State at the Eleventh Arab Summit Conference held at Amman in 1980, expressing their conviction that Arab men and women were both the instrument and the objective of development,

Adhering to the Charter of the United Nations, which seeks to promote humanitarian causes, guarantee human freedoms and needs and provide the basic requirements and conditions for a better life for mankind as a whole,

Recognizing the importance of achieving Arab comprehensive development that will satisfy the needs and aspirations of present generations, without jeopardizing the rights and aspirations of future generations, by mobilizing
Arab resources, developing productive forces and satisfying the social needs, both material and moral, of the Arab person in the light of modern patterns of development appropriate for and protective of the environment,

Convinced that the Arab region, given its great human, natural and financial resources, as well as the elements of homogeneity of the Arab countries, namely, language, heritage, common history, common destiny and geographical location, possesses great potential for numerous forms of cooperation, coordination and joint Arab action in various development fields,

Believing that a just peace is an essential requirement for the realization of comprehensive development,

Believing also that the continued occupation by Israel of Arab territories constitutes an insurmountable obstacle to the achievement and maintenance of such peace,

Acknowledging the right of the Arab nation to live in security in its homeland and the right of each of its peoples to live in freedom, security and peace of mind in their respective countries,

Affirming the right of the Palestinian Arab people to rid themselves of the occupation and to establish their own independent State on their national soil and to resist such practices as settlement, expulsion, deportation, detention, repression, environmental destruction, dissipation of resources and denial of basic human rights, all of which obstruct their progress towards the realization of comprehensive development, and also affirming the right of the Palestinian refugees to return to their homeland pursuant to the relevant United Nations resolutions,

Acknowledging the influence of international economic relations on comprehensive development in the Arab States, particularly in the light of the termination of the cold war and the emergence of radical changes in the international order, and in recognition of the importance of equitable interdependence in such relations, and of the need to enhance and develop those relations to serve the goals of development and socio-economic progress in the various parts of the world,

Recognizing that the realization of Arab comprehensive development—given the need to take human development into careful consideration—will require that a balance be struck between the rights of the individual and society, bearing in mind that the success of the development process depends largely on the prevalence of an appropriate external climate,

Believing in the ability of the Arab person, enjoying democracy, social equality and human rights, and given objective conditions favourable to progress and effectiveness in development efforts, to confront the challenges and dangers facing the Arab world,

Acknowledging that the creation of those objective conditions requires a comprehensive evaluation of past development efforts and their achievements, and particularly an evaluation of human development efforts and of population conditions and policies in the countries of the Arab world in accordance with the development strategies adopted by Arab States and in Arab and international instruments,
Conscious that the past decade witnessed commendable efforts in population policies and human development in the Arab world, although those efforts fell short of the aspirations expressed in the Amman Declaration on Population in the Arab World adopted by the Regional Population Conference in the Arab World held from 25 to 29 March 1984,

Convinced that the countries of the Arab world have witnessed many new developments and changes over the past 10 years, which necessitated the formulation of comprehensive population policies integrated with overall Arab development in its various dimensions during the coming decade,

Aware that, in spite of the varying priorities of population policies from one Arab State to another, there is a need to formulate a clearly defined Arab population strategy to ensure optimal utilization and distribution of human resources, integrated into development,

Believing that the pan-Arab perspective can serve as a significant approach when addressing population issues and challenges in the Arab world,

Recognizing the importance of cultural and religious dimensions in determining population behaviour patterns,

Pursuant to the provisions of the World Population Plan of Action (Bucharest, 1974) and the recommendations of the Mexico City Conference of 1984 designed to promote a more intensive and rapid implementation of that Plan, as well as the provisions of the World Conference to Review and Appraise the Achievements of the United Nations Decade for Women (Nairobi, 1985), the World Declaration on Children issued by the World Summit on Children (New York, 1990) and the United Nations Conference on Environment and Development (Rio de Janeiro, 1992),

Pursuant also to the Amman Declaration on Population in the Arab World (1984), the Arab Declaration on Environment, Development and Future Prospects (Cairo, 1991), the Arab Plan for the Protection, Care and Development of Childhood (Tunis, 1992) and the resolutions of specialized Arab ministerial meetings, and on the basis of the achievements of the Arab world in the light of the principles and objectives contained in all those instruments,

Invoking United Nations resolutions (General Assembly resolution 47/176 and Economic and Social Council resolutions 93/1991, 37/1992 and 4/1993) concerning the convening of the International Conference on Population and Development (Cairo, 5-13 September 1994) which emphasize that the question of population and sustained economic growth and sustainable development will constitute the overall topics of the Conference,

GENERAL PRINCIPLES

Firmly establishes the following general principles for population policies:

1. Human development is the starting point of development efforts aimed at achieving a satisfactory quality of life in the Arab world, with all that
this implies by way of socio-economic progress, justice, democracy and protection of human rights.

2. The family is the basic unit of society and it is therefore necessary to create all the appropriate conditions needed to preserve its integrity, raise its standard of living, protect its values and cohesion and provide its members with opportunities for a decent life.

3. Women, like men, play a crucial role in society. They do so not only as mothers but as essential factors in resource management, economic activity and national development. Development cannot be realized without ensuring women’s participation therein, improving women’s quality of life in all its aspects and securing the economic, social, educational, cultural, psychological and health conditions needed to enable them to play their role fully as citizens.

4. Children have a basic right to a healthy, happy and secure life through the provision of health care, modern education and other appropriate services and conditions.

5. The population issue is closely interrelated with socio-economic changes, the cultural environment and the political framework, and hence with the development process. Population variables are determined by the broader social environment, and the social, economic, cultural, political and environmental components of the actual conditions dictate the attitudes of individuals towards population dynamics, thereby determining population dimensions. Population variables, in turn, affect those dimensions at the national, regional and international levels.

6. An integrated approach to the population issue requires consideration of its various dimensions, such as population size and structure, growth rates, geographical distribution, national and pan-Arab security and other characteristics, as well as recognition of the fact that these dimensions interact and, consequently, should not be treated separately as isolated aspects in any population policy; it should also be recognized that these population dimensions are influenced by the processes of reproduction, mortality and internal and external migration.

7. In view of the special conditions in the Arab territories under Israeli occupation and the ensuing displacement and forcible migration of their population, the latter’s population problems need to be addressed from a special perspective which gives priority to those dimensions that relate to steadfastness, national security, political considerations and the need to counter the aggressive demographic schemes of the occupation authorities.

8. One of the basic human rights recognized in the World Population Plan of Action of 1974 is the right of couples to choose freely and responsibly the number and spacing of their children. To enable them to exercise this right, they must have access to the necessary education, information and services. Present and future demand for family planning must be met. The Arab States should be called upon, regardless of their stand on population growth, to provide for family planning services as a basic human right of couples.
9. The Arab States which adopt a policy of modifying population growth rates should integrate population policies into the framework of national development plans.

10. Arab sustainable development depends on the levels of economic growth and social progress, including diversification of productive capacities and higher rates of production through reliance on the optimal rational utilization of material and human resources, as well as the development and use of environmentally safe technology; it takes environmental considerations into account in planning operations and in economic policies with a view to improving the quality of life for the present generations, without jeopardizing the right of future generations, as well as achieving equitable distribution, creating job opportunities and satisfying the basic material and moral needs of Arab men and women.

11. Effective measures to overcome current population problems in the Arab world through diligent efforts to achieve development will be severely affected by the increasingly rapid and radical changes that have taken place on the world stage in recent years and which necessitate the adoption of a collective self-reliance strategy within the Arab world, as well as close cooperation with the developing countries. They also necessitate diligent efforts to change the status of the Arab economy in the present world economy with a view to attaining further self-reliance, mutual equitable interdependence and active and positive involvement in international economic relations.

12. Since some economic and social conditions in many Arab countries interact strongly with population problems, reforms are needed to rectify those conditions and the imbalances that they reflect. However, these reforms have economic and social dimensions that differ from one Arab country to another, and special attention must therefore be paid to the social effects of those reforms, disregard of which would be detrimental to human development as one of the kingpins of sustainable development.

13. Since the Arab economy forms part of the world economy and is affected by the changes and disruptions to which the latter is prone, there is a need to promote forms of inter-Arab and Arab-international cooperation, as well as endeavours to overcome international problems and restructure the world economy in such a way as to ensure greater North-South balance and equality in order to improve terms of trade.

14. The mounting indebtedness of some Arab countries tends to obstruct the implementation of population policies and programmes. Therefore, efforts should be made, in coordination with the creditor countries, to devise appropriate formulas for the rescheduling of debt servicing, particularly that of an inter-Arab nature, for purposes of investment for the benefit of these policies and programmes.

15. The industrialized countries are called upon to adopt policies aimed at the achievement of a better balance between the population size and resources of this planet by reducing the huge expenditures on armament and curbing excessive consumerism, which is squandering the resources of the entire world. They are also called upon to adopt more effective orientations in
an effort to conserve resources, protect the environment and achieve a higher
level of well-being for all mankind.

16. The population problems in the Arab countries might appear less
acute if viewed from a pan-Arab perspective. This requires the formulation of
an Arab population policy based on current conditions. It should seek solu-
tions to population problems in each individual country within a comprehen-
sive development framework. Such a policy should constitute a pan-Arab
framework for the population policies of individual Arab countries.

17. Population growth is a factor in socio-economic development.
Accordingly, population policies should be formulated not on an individual
basis but rather within the context of an integrated development policy.
Account should be taken of the periods of time needed to influence population
variables. Population growth policies should therefore be based on the eco-
nomic, social, cultural and health situation in each country.

18. A spirit of democracy, collective endeavour and individual initia-
tive should be promoted and fostered in the life of the Arab person by respect-
ing his will and his creative capacities under appropriate laws and legislation
that ensure protection of his achievements and respect for his human dignity
and rights.

OBJECTIVES

In the light of the preamble and general principles stated above, the Confer-
ence establishes the following objectives:

1. The formulation and implementation of integrated population poli-
cies, programmes and activities in the Arab countries within the framework of
development efforts aimed at:

   (a) Achieving appropriate population growth rates through provision
       of the services needed to attain national policy goals. In the case of countries
       wishing to reduce their population growth rates, this requires provision of the
       services needed to develop and enhance family planning and family protection
       services, including maternal and child health care, and the formulation of eco-
nomic, social, health and education policies to help create the requisite cli-
mate in which couples will accept and react to these objectives;

   (b) Reducing mortality rates to the lowest possible level, especially
       maternal, child and infant mortality;

   (c) Reaching a geographical distribution of the population in keeping
       with the requirements of development and healthy environment by rationaliz-
ing urban growth and paying attention to rural areas in order to improve the
       quality of life.

2. The establishment of general principles to coordinate the population
policies of the Arab countries, and the provision of the means for their imple-
mentation and monitoring. Endeavours should also be made to implement
Arab agreement regulating the movement of labour among the Arab countries
in such a way as to ensure maximum developmental benefits for both the Arab
countries of origin and the Arab host countries, and to grant priority to Arab labour in the latter.

3. Efforts should be made to counter the methods that Israel is employing to violate human rights, impose forced migration on the Palestinian Arab people and disrupt the natural course of life in the occupied Lebanese territories and in the occupied Golan Heights in the Syrian Arab Republic.

4. The granting of high priority to human development through an enhancement of population characteristics in the context of population policy and its developmental aspects. Care should also be taken to meet the needs in regard to nutrition, health care, the eradication of illiteracy, the provision of means of education and endeavours to combat unemployment. There is a need to ensure a more equitable distribution of income, to combat poverty and to provide basic commodities and public services. Efforts should be made to enhance the situation and status of women and improve child welfare, care of the disabled, arrangements for grass-roots participation and the protection of democracy and human rights.

5. To further sound religious orientations and understanding of population issues in general, and of the spacing of births in particular.

RECOMMENDATIONS

In the light of the principles set forth in this Declaration, and with a view to achieving the objectives contained herein, the Conference calls upon the Governments of the Arab States to observe the following guidelines:

Human development and its relationship to development

Recommendation 1. Population policies should be formulated within the framework of a comprehensive strategy for development, paying due regard to the mutual interaction among them.

Recommendation 2. Special attention should be paid to human development and the necessary resources should be allocated to its achievement in a manner consistent with population policies, since human development is an objective in itself. Resources should be allocated to achieve human development, especially in social sectors such as health, education, training, housing and healthy environment.

Recommendation 3. Regional non-governmental organizations and the private sector should be encouraged to play an increasing role in the achievement of population objectives and to contribute to the implementation of population policies.

Recommendation 4. Human development should be viewed as relating to human requirements, activities and aspirations, including production and distribution, culture and the arts, enjoyment of democracy, protection of human rights and participation by all male and female members of society in decision-making.

Recommendation 5. Regard should be shown for considerations of justice and equal opportunity for the present and future generations and the right
of each of them to enjoy the resources of the Arab world. This requires the ongoing development of such resources in a manner that meets the needs of the present generations without diminishing the possibility of meeting the needs of future generations: the welfare of the present generations should not be based on additional economic and environmental loans to be repaid by future generations.

Recommendation 6. The Palestinian people should be enabled to recover their freedom and sovereignty over their natural resources so that they cannot only formulate a population policy in keeping with their national interests and consistent with their development aspirations but also implement real development projects, stressing their need for international protection.

Population, environment and development

Recommendation 7. There is a need for a more thorough understanding of the interrelationship between population, resources, environment and development. The conduct of further research should therefore be encouraged with a view to developing such understanding, as well as new conceptual frameworks and appropriate analytical tools and indicators, and exchanging the findings of such research.

Recommendation 8. Data and information networks on environmental, population and development variables should be established to facilitate the decision-making needed for the achievement of compatibility among these variables within each individual Arab country. An Arab programme should be prepared to link these networks for the purpose of coordinating common population, environment and development issues among the Arab countries.

Recommendation 9. The environmental effects of new projects and activities must be examined as a basic component of the evaluation study of these projects and activities so that the phenomenon of worldwide industrial relocation does not lead to a concentration of pollutant industries in the third world, of which the Arab countries form part.

Recommendation 10. Pan-Arab development policies should be formulated to meet present needs, without prejudicing the ability of future generations to meet their needs. There is a need to speed up the implementation of the Arab sustainable development programmes approved by the Council of Arab Ministers for Environment Affairs in 1991, the aim of which is to address the various environmental and natural resource issues in the Arab world, particularly land degradation and measures to combat all forms of environmental pollution.

Recommendation 11. Pan-Arab plans should be formulated to ensure the rational use of land, water and other resources and prevent their depletion and deterioration in order to promote human well-being.

Recommendation 12. Measures should be taken to combat poverty and unemployment and to improve the quality of life in urban and rural environments and industrial areas. Special priority should be accorded to the implementation of low-income housing schemes, the provision of clean water and
sanitation in densely populated areas and the adoption of appropriate technologies to that end.

Recommendation 13. National non-governmental organizations should be involved in the formulation and implementation of policies and programmes in the field of population, development and environmental protection. These organizations should be given material, technical and administrative support, and their relations with official government institutions and international and Arab organizations in connection with the various development programmes and services that they undertake should be coordinated.

Recommendation 14. The Arab person should be protected through the promulgation of legislation and the adoption of the measures needed to prevent the use of the coastal land and territorial waters of the countries of the Arab region as a dumping ground for toxic wastes from the industrialized countries. Such dumping should be regarded as a violation of the principles of international relations, which call for respect for ethical concepts in such relations. Appropriate national control bodies should be established to monitor this matter in order to limit its long-term detrimental effects on individuals and the environment.

Recommendation 15. Efforts should be made to counter the policies of settlement, confiscation of land, demolition of houses, restriction of building permits, seizure of water resources, burial of dangerous wastes and cutting down of trees, which Israel has been pursuing in the occupied Palestinian territories since 1967.

Population distribution and urbanization

Recommendation 16. Special attention should be paid to policies aimed at improving the quality of life in rural areas by promoting the economic, social and environmental dimensions of integrated rural development endeavours in such a way as to achieve population stability in these areas and curb rural-urban migration.

Recommendation 17. Facilities for production and life in small and medium-sized urban areas should be promoted in such a way as to secure the continued economic and social vitality of these areas, enable them to retain their populations and provide them with opportunities for development and population stability.

Recommendation 18. New sites for production should be located, whenever possible, away from present densely populated areas, within the framework of country planning, in order to achieve a better distribution of the population in the geographical area of the Arab countries and to achieve equitable and harmonious regional development.

Recommendation 19. Greater endeavours should be made to obtain reliable data on population movements, on factors associated therewith and on population needs through population censuses, socio-demographic surveys on migration and special migration and area studies.

Recommendation 20. Studies should be undertaken for the purpose of understanding the factors and motives underlying internal migration with a
view to planning, implementing and evaluating population distribution pro-
grammes.

*International migration*

**Recommendation 21.** The Arab States should coordinate and cooperate
in planning Arab labour mobility among them in order to maximize the bene-
fit to both the sending States and the receiving States, giving consideration to
the accordance of priority to the employment of Arab labour and endeavouri-
ing to implement bilateral and multilateral Arab agreements in this regard.

**Recommendation 22.** The Arab labour-sending countries should dili-
genously endeavour to provide employment opportunities by diversifying their
sources of production and formulating training and development plans and
programmes to promote stability of their labour force in its country of origin.

**Recommendation 23.** There is a need to protect the human rights of Arab
migrant workers and their families in the labour-sending and labour-receiving
countries.

**Recommendation 24.** There is a need for international support for develop-
ment endeavours in the labour-sending Arab countries in order to help to
curb labour migration, particularly informal migration.

**Recommendation 25.** All possible Arab and international action and
measures should be taken to put an end to hostile behaviour towards Arab
migrants, particularly Maghrebis, to safeguard all their workers’ and human
rights and to regulate their situation within the context of the Euro-Arab dia-
logue.

**Recommendation 26.** Endeavours should be made to facilitate the inte-
gration of returning Arab labour in their societies of origin, to solve their prob-
lems and to integrate them in productive and social activity in their new areas
of residence in such a way as to enhance their contribution to national devel-
opment endeavours.

**Recommendation 27.** All ways and means should be adopted to protect
migrants, refugees and persons forced to move by upheavals and wars, espe-
cially women and children. International support should be extended to the
receiving countries in order to accommodate them until such time as they
return to their home countries, especially if the host countries are among the
least developed countries, with a view to easing the resulting burden placed
upon them.

**Recommendation 28.** Arab and international cooperation plans and pro-
grammes should be formulated to support the Arab States that are suffering
from the problem of an influx of refugees from neighbouring States.

**Recommendation 29.** Specialized studies on international migration
should pay due regard to national priorities. Regional and international donors
are called upon to support surveys, research and policies concerning external
migration in the Arab countries in view of the developmental significance of
such migration. The earlier recommendations concerning the need to provide
the requisite support for the conduct of a world migration survey, along the
lines of the world fertility survey, are reaffirmed.
Recommendation 30. The requisite Arab measures should be taken to secure the immediate cessation of all inhuman Israeli practices against the Palestinian, Syrian and Lebanese peoples, particularly those involving forced migration, deportation and violations of human rights.

Recommendation 31. Endeavours should be made to halt Jewish immigration aimed at bringing about radical changes in the region, including disruption of the demographic balance, as these changes constitute a direct and indirect danger to the occupied Arab territories through the intensification of settlement operations and exploitation of the resources of these territories for the benefit of the new immigrant; they also constitute a destabilizing factor in the region.

Recommendation 32. International and Arab support should be provided for the Palestinian national economy in the occupied territories to help end its dependence on the Israeli economy; the productive sectors should be encouraged; Israeli exploitation of the markets of the West Bank and the Gaza Strip should be limited; the exploitation of workers from the West Bank and Gaza forced by deteriorating economic conditions in the occupied territories to work in the various economic sectors within Israel should also be limited.

Women, population and development

Recommendation 33. In view of the crucial importance of the role and status of women in development and their effects on demographic behaviour, age at marriage, fertility and infant, child and maternal mortality rates, policies and programmes should seek to improve the status of women as one of the goals of national development plans.

Recommendation 34. The Arab States that have not yet ratified the United Nations Convention on the Elimination of All Forms of Discrimination against Women are called upon to ratify and implement that Convention in a manner consistent with their domestic legislation. Efforts should also be made to develop legislation to improve the situation of women, particularly in regard to relations within the family, employment, social security health insurance, pensions, maternity leave, appointments, job promotion opportunities and education etc. Distinction should be made between mistaken social ideas and the accurate understanding of religion.

Recommendation 35. The reproductive role of women should in no way be used as a reason for limiting women’s right to work, education and participation in public life.

Recommendation 36. Policies and programmes should be formulated to help:

(a) Ensure the contribution of Arab women in regard to work in the various societal activities, at all levels in order to promote equality between women and men and provide the conditions and services that are conducive to such contribution;

(b) Increase the economic potential of women by providing them with opportunities for education, training, literacy programmes and employment in the various production sectors;
(c) Promote the participation of women in public life at all levels, including decision-making;

(d) Provide an opportunity for women to exercise an informed choice regarding birth control and facilitate their access to the services necessary for that exercise.

Recommendation 37. There is a need to adopt programmes that accord priority to rural women, and the Arab countries should be urged to monitor the implementation of the recommendations of the Summit on the Economic Advancement of Rural Women held at Geneva in 1992.

Recommendation 38. Efforts should be made, at the country and regional levels and through specialized centres, to establish an adequate database concerning the various aspects of the life of Arab women in order to facilitate research and in-depth studies to identify the everyday problems and difficulties with which they are faced, with a view to the formulation of policies and programmes conducive to the solution of such problems and difficulties and to the enhancement of their status and quality of life.

Recommendation 39. Support should be given to national non-governmental organizations, women’s federations and associations concerned with women, population and development in order to help them to play their role in enhancing women’s awareness so that they can contribute to the development and participate in all spheres of life. Support should also be given to programmes of research, studies and training concerning women and their role in development. Use should be made of Arab training and research centres for women, the activities of which should also be coordinated.

Maternal and child health and family planning

Recommendation 40. Programmes relating to maternal and child health (MCH) and family planning should be designed in such a way as to ensure:

(a) Acceptance of the question of family planning, in its broad sense, as a right of couples within the framework of its role in enhancing the various aspects of family health;

(b) The integration of family planning services into other family health services, including the expansion and streamlining of a system for the provision of MCH and family planning services, as well as health education programmes, within the framework of primary health care.

Recommendation 41. In Arab countries where fertility levels are high:

(a) Efforts should be made to set appropriate fertility and family planning targets consistent with the development goals of each country;

(b) Health and nutrition education activities related to MCH and family planning should be strengthened;

(c) The quality and accessibility of family planning services should be improved by arrangements for well-trained persons to respond to the needs of the beneficiaries and offer a wide choice of family planning services in keeping with the broader reproductive health needs of the population, including prenatal and postnatal care;
(d) The provision of an appropriate socio-economic environment for the achievement of reproduction rates consistent with the desired population growth rates.

Recommendation 42. There is a need to formulate and implement appropriate programmes to lower infant, child and maternal mortality rates.

Recommendation 43. Programmes should take full advantage of the potential contributions of non-governmental organizations, including women’s non-governmental organizations, so that they can continue to support national programmes in the fields of MCH and family planning. In particular, greater use should be made of the resources, experience and expertise of local non-governmental organizations in order to strengthen their role. There is also a need to actively advocate the use of their services and improve the availability, social acceptability and effectiveness of family planning services.

Recommendation 44. Issues concerning Arab children should be accorded priority in development plans and the availability of child services should be increased, including health, nutrition and education services. Measures should also be taken to combat the phenomena of child labour and school drop-outs and public awareness programmes should be formulated to counter the phenomenon of sexual discrimination.

Recommendation 45. Information, education and communication (IEC) programmes should include MCH and family planning messages, with particular emphasis on the following:

(a) Agricultural extension programmes;
(b) Activities of professional and trade unions, cooperatives etc.;
(c) Women’s programmes and federations;
(d) Youth programmes for both sexes;
(e) Sexual and mental health programmes.

Recommendation 46. There is a need to upgrade management information systems (MIS), so that they can provide timely and high-quality information, and to adopt suitable strategies for the use of comprehensive, rapid and low-cost surveys for the purposes of appropriate monitoring and evaluation programmes. There is also a need for appropriate training to ensure the proper use of such information by MCH service providers and instructors.

Recommendation 47. Concerted efforts should be made to undertake relevant research on the improvement of reproductive and mental health and to put the findings of such research into practice through their incorporation in ongoing policies and programmes. There is a particular need to promote research on the socio-cultural factors that influence fertility, and on associated factors related to the use of methods of contraception and their incorporation in preventive health and MCH programmes in a manner consistent with socio-cultural and administrative conditions.

Recommendation 48. There should be closer inter-Arab cooperation in the manufacture, promotion and distribution of family planning aids. Use should be made of the experience gained by the Arab countries that have played a pioneering role in this field.
Recommendation 49. There is a need to relieve the sufferings of Palestinian families in the occupied territories, which are directly attributable to the practices of the Israeli occupation authorities and which have led to a deterioration in the standard of public health, a lack of MCH and family protection programmes and high mortality rates, particularly among infants and children.

Information, education and communication

Recommendation 50. IEC programmes in the field of population should become basic components of national education and information systems.

Recommendation 51. IEC messages and curricula should be socially rooted and readily acceptable to the various population target groups, particularly in rural areas. Hence, these programmes and materials should be based on the results and findings of field research aimed at determining the values, attitude and behavioural patterns needed to define the objectives and contents of effective IEC programmes and activities in the field of population.

Recommendation 52. IEC programmes should be designed within the framework of an integrated approach so that they can play a major role in facilitating the understanding of women’s issues in order for women to make an informed choice regarding birth control and gain access to the requisite aids therefrom, and also in promoting the status of women and their full participation in population and development affairs.

Recommendation 53. Population education should be more fully incorporated in all stages of formal and informal education with a view to stimulating awareness of population and development issues and promoting positive attitudes and rational behaviour among the target groups in regard to such issues, thereby achieving a balance between population and available material resources at the household and community levels.

Recommendation 54. When formulating and designing population communication programmes, due regard should be shown for the principle of integration and harmonization, i.e. the need to coordinate these programmes with a view to achieving their objective in a manner consistent with their different materials, concepts and contents relating to the issues of population and development.

Recommendation 55. It is important to ensure the availability of human resources capable of playing their roles in IEC population programmes, which requires the training of personnel in this domain.

The role of national non-governmental organizations in the achievement of development

Recommendation 56. In view of the substantial Arab non-governmental contribution to development over the past two decades, and in the light of the growing Arab and international interest in the role of national non-governmental organizations in development, the Conference stresses the need to:

(a) Promote Arab coordination among national non-governmental organizations active in the field of population in the Arab countries and enable
them to participate in country and pan-Arab programmes through the establishment of the requisite technical structures for that purpose;

(b) Strengthen the role of Arab national non-governmental organizations, as partners, in order to enable them to support and supplement government efforts to implement the Second Amman Declaration on Population and Sustainable Development in the Arab World;

(c) Invite Arab and international financing bodies and funds to provide financial support for projects implemented by Arab national and non-governmental organizations in the field of population, environment and development;

(d) Invite international financing organizations, the United Nations, the European Community and international and regional agencies, bodies and funds to provide financial and technical support for Arab national non-governmental organizations and encourage their participation in regional and international meetings and conferences;

(e) Encourage the endeavours and initiatives that are being undertaken in the Arab region with a view to coordinating cooperation and interlinkage among Arab national non-governmental organizations between them, on the one hand, and official and popular bodies and regional and international organizations and agencies, on the other hand;

(f) Encourage the participation of representatives of national non-governmental organizations in official delegations to national, Arab and international conferences in view of the positive results of such participation;

(g) Support and finance training programmes and projects for the administrative and institutional development of Arab national non-governmental organizations, with a view to enhancing the performance of such organizations on an effective scientific basis.

Special categories

Recommendation 57. Special attention should be directed towards juveniles and young people through the provision of education, contemporary culture, arts, sports, and all forms of social welfare to protect them from falling prey to the dangers of addiction, violence and extremism. Young people should be provided with employment opportunities to combat unemployment among them.

Recommendation 58. Particular care and attention should be given to talented individuals through the formulation of special programmes to develop their potential in various fields.

Recommendation 59. Special protection should be afforded to special groups such as orphans, the homeless, foundlings, victims of disasters and wars and juvenile delinquents.

Recommendation 60. Special care should be given to elderly and aged men and women, and efforts should be made to facilitate their access to health and social services. The role played by the family and local community institutions in this regard should be intensified.
Recommendation 61. The population of the Arab world, particularly mothers, children, the elderly, and the sick should not be subjected to any negative or inhuman effects, contrary to human rights, as a result of political or any other decisions.

Recommendation 62. Special policies should be formulated to cater for the welfare and rehabilitation of disabled members of the population, including provision of the resources required for health infrastructure and personnel and of the appliances and equipment needed to enhance their quality of life and integrate them into society.

Structural adjustment and population policies

Recommendation 63. In order to unleash development forces, including manpower, it will be necessary to pay special attention to raising real economic growth rates, correcting structural imbalances in the Arab States and formulating appropriate policies with due regard for the maintenance of a balance between country-specific economic, demographic, and social considerations.

Recommendation 64. The adjustment policies applied by some Arab States are having recessionary and other detrimental consequences, such as a reduction in public spending on social services and abolition of subsidies, which have had adverse effects on human development, increased unemployment and lowered the standard of living. Therefore, economic policy should focus on giving priority to social services, particularly in the field of health and education. The cost of such policies must also be distributed among all social categories and groups, in accordance with their respective ability to bear such costs and with due regard for the principle of social justice and for the circumstances of each Arab State. Population development policies must be consistent with adjustment policies in order to avoid any increase in the adverse effects of adjustment.

Recommendation 65. The Arab world possesses enormous potential resources, material and non-material, which could be used for purposes of economic reform and sustainable development through inter-Arab cooperation in order to alleviate the burdens resulting from structural adjustment policies and achieve human development.

Data, research, exchange of information and training

Recommendation 66. Efforts should be made to develop an integrated system of population censuses, civil registration procedures, household surveys, in-depth studies and other related sources of data with a view to providing high-quality and timely information for population policies and monitoring, and to supporting national agencies responsible for the provision of such data. The Arab States should be called upon to undertake periodic population censuses on the understanding that expertise and support will be provided by regional and international sources to those countries lacking the material and technical means to achieve that end.
Recommendation 67. The availability of the technical skills needed for the collection, processing and analysis of population data must be ensured. In this connection, efforts should be intensified to train and upgrade national technical capabilities at all levels in order to achieve maximum benefit from the utilization and application of modern data-management technologies.

Recommendation 68. Research programmes should be undertaken and coordinated to study the principal population issues and their relationship with environment and development. In particular, heavy emphasis should be placed on the promotion of specialized research on population measures and policies. The Arab States should be urged to attach high priority to population research, to provide material and technical support for country and pan-Arab statistical agencies and to establish, support and strengthen population research centres.

Recommendation 69. The establishment and maintenance of modern database systems, both numerical and bibliographic, should be encouraged at the country and regional levels in order to disseminate population data and information more efficiently and effectively and to ensure coordination among them.

Recommendation 70. The exchange of technical expertise should be encouraged along with visits among national governmental and non-governmental parties engaged in research, training and programmes relating to population activities in the Arab countries.

Recommendation 71. Endeavours to standardize the definitions and terminology used in population research in the Arab world should be supported in order to ensure data comparability.

Recommendation 72. The Palestinian people should be enabled to undertake a general population and housing census in the occupied territories and to establish a national statistical department there in view of the inaccuracy of Israeli statistics.

Arab and international cooperation

Recommendation 73. International cooperation within the framework of the United Nations system has to continue to provide technical and financial support for population activities to assist the Arab States in their efforts to achieve population and development goals.

Recommendation 74. ESCWA and the League of Arab States are called upon to increase and expand the scope of their contributions to a closer understanding of Arab population issues and to promote regional cooperation in the field of population.

Recommendation 75. Support should be given to UNFPA to enable it to play a leading and effective role in providing assistance in the field of population policies, programmes and projects in the broader sense. States Members of the United Nations are invited to make financial contributions to UNFPA in a manner commensurate with the increasing needs of population projects.
Recommendation 76. UNFPA is requested to intensify its support for population programmes and activities in the Arab region through bilateral and regional mechanisms in order to:

(a) Expand and enhance its technical cooperation programmes with each Arab country, especially the least developed among them, with a view to helping them to address their population problems, deal with the causes of those problems and implement their population policies effectively;

(b) Intensify its cooperation with the Economic and Social Commission for Western Asia, the Economic Commission for Africa, and the League of Arab States in order to support their ongoing endeavours to implement regional population programmes and projects;

(c) Maintain and increase its efforts to provide technical support for national population programmes and projects through the newly-established Country Support Team/Regional Office for the Arab States;

(d) Resume its activities in Lebanon and finance population activities as part of the process of reconstruction, including data collection and the preparation of population studies and policies aimed at restoring normal life in Lebanon;

(e) Support the efforts of those countries that have achieved good results in the field of population policies, in order to enable them to continue the implementation of their programmes and safeguard their achievements in this field.

Recommendation 77. International and Arab organizations should support the efforts of regional training centres and should utilize their expertise and capabilities.

Recommendation 78. Donor States, international financial institutions and non-governmental organizations are urged to mobilize additional resources to assist the Arab countries in achieving their national population goals, particularly in the least developed Arab countries, since the emerging population issues in the region will become more diverse and complex in the coming decade. Every effort should be made to reach the target of $US 9 billion for worldwide population activities from all sources—domestic and international—by the year 2000.

Recommendation 79. Emphasis should be placed on the role of Arab funds in financing country and regional projects and research relating to population activities within the framework of the development plans of the Arab countries and joint Arab action, as well as the role of those funds in supporting research and training institutions in the fields of population statistics and planning.

Recommendation 80. The Arab States are called upon to formulate plans and programmes based on the present Declaration and to establish a mechanism for their implementation, monitoring and evaluation. In order to achieve that, emphasis is placed on the need for the provision of technical and material services by UNFPA, ESCWA, the League of Arab States, Arab and international funds and other Arab and international federations and financial institutions.
Recommendation 81. Support should be given to the endeavours of the secretariat of the League of Arab States in the field of population surveys and studies. Its coordinating role among Arab bodies active in the field of population should be strengthened and its activities should be supported in order to enable it to meet the needs of joint Arab action in the field of population and to continue its monitoring and implementation of the recommendations of the Arab Population Conference.

Recommendation 82. Support should be given to the endeavours of ESCWA in socio-economic development fields, particularly in regard to population issues. Arab and international funds, and especially UNFPA, are invited to provide ESCWA with the support required to enable it to play its role fully in the field of population.
LATIN AMERICAN AND CARIBBEAN REGIONAL
CONFERENCE ON POPULATION AND DEVELOPMENT

The Latin America and Caribbean Population and Development Conference, jointly sponsored by the Economic Commission for Latin America and the Caribbean (ECLAC) and the United Nations Population Fund (UNFPA), was held at Mexico City from 29 April to 4 May 1993. As part of the preparations for that Conference, a meeting of government experts took place at Saint Lucia from 6 to 9 October 1992. The discussions centred on the following six themes: population growth, structure and distribution in Latin America and the Caribbean; socio-economic trends and implications; population dynamics and development in the Caribbean subregion; population policies and programmes; population growth and distribution and their relation to development and the environment; women and population dynamics; and family planning, health and family well-being. The Conference adopted the following Latin American and Caribbean Consensus on Population and Development.

LATIN AMERICAN AND CARIBBEAN CONSENSUS ON
POPULATION AND DEVELOPMENT

THE SITUATION OF POPULATION AND DEVELOPMENT IN LATIN AMERICA
AND THE CARIBBEAN IN THE EARLY 1990S

The World Population Conference held at Bucharest in 1974 and the World Population Plan of Action adopted by that Conference represent a historic milestone in the consideration of population issues at the world level. They stipulated that population policies should help to harmonize demographic trends with development trends and formulated important recommendations. At the Latin American and Caribbean level, these ideas began to gain recognition at the 1974 Regional Preparatory Conference at San José, which was followed by other meetings (Mexico City, 1975; Havana, 1983; International Conference on Population at Mexico City in 1984) and meetings such as those of the Committee of High-level Government Experts (CEGAN). It was in this context that country-based institutional frameworks were created to put into practice the recommendations of these meetings, which took the form of population councils or population units in ministries of planning. The Regional Conference on Population and Development at Mexico City in 1993 and the International Conference on Population and Development, to be held at Cairo in September 1994, offer new opportunities for assessing the progress made and for furthering the debate and organizing future actions.
The 1980s represented a period of contrasting economic and social features for most Latin American and Caribbean countries. On the one hand, the region took a giant step backward in terms of real per capita output—which dropped, by the end of 1989, to its lowest level in 13 years—and experienced heavy macroeconomic imbalances and a deterioration of the social context as well. On the other hand, there were also some positive factors: in the realm of politics and institutions, the near-total prevalence of democratic and participatory systems; and in the social and demographic sphere, advances on various fronts, such as improved educational coverage, a decline in infant mortality and changes in reproductive patterns, which brought benefits in terms of maternal and child health. It is noteworthy that in spite of the economic setbacks experienced, there was a more widespread awareness of the need to change production patterns and labour relations to incorporate the region into the new dichotomies, so that those that would pit growth against equity, industry against agriculture, the domestic market against the external market, the State against private agents, or central planning against market forces, could be overcome.

Faced with the challenges presented by the crisis of the 1980s, and the difficulty of finding adequate solutions, the Governments have identified actions to promote the well-being of all segments of the population, while at the same time ensuring environmental sustainability in a democratic and participatory framework. The present goal is to change production patterns as a linchpin for the region to achieve a growing and genuine competitive advantage, with a view to progressively raising productivity and creating prospects for effective equality of opportunity for the whole population. Genuine competitiveness requires social equity, together with increased investment in physical capital and a significant investment in human resources.

In this framework, the population issue can be seen from two angles: as a beneficiary of development and as a fundamental agent of the production process. This means that the key component, in addition to the training of human resources, is the latter’s quality of life, and hence priority should be given to education, health and job training. The availability of more highly trained human resources is also a contributing factor in reducing the incidence of poverty, by virtue of favouring greater economic growth and offering better opportunities for entry into the workforce for all segments of the population, provided that social policies are strengthened as well in order to reduce prevailing societal inequalities. From this angle, the fast demographic growth rate and high poverty levels make it more difficult for the countries to improve the training and productivity of their labour force.

Looking at population as a beneficiary of development strategies, the subject of equity becomes even more relevant as one of the pillars of the relationship between population and development, taking into account the inequalities that exist within countries. The crisis of the 1980s, which exacerbated inequality of access to the fruits of development, has led to a rise in poverty, immersing vast segments of the Latin American and Caribbean population; from the demographic standpoint, this is expressed in differences in morbidity and mortality, particularly among mothers and children, and in ter-
ritorial mobility and fertility patterns, according to social sectors and ethnic groups. In particular, it has been observed that there is a shortage of family planning programmes adapted to the principles of comprehensive assistance to mothers and children. The meeting of these demands together with others of a social nature (such as health or education), would not only meet the requirement of equity, but would have positive effects on human resources development.

One of the most outstanding demographic changes in Latin America and the Caribbean in the past 25 years is the pronounced decline in fertility, from 6 to 3.5 children per woman, which reduced the annual average population growth rate to 2 per cent by the second half of the 1980s. This rate is projected to fall to 1.7 per cent annually in the 1990s. At the same time, advances have been made with respect to mortality, as witnessed by the fact that life expectancy at birth has increased from 57 to 69 years. These trends have also modified the age structure of the population, accentuating the demographic ageing process, whose effects will be felt in the medium term, in the first phase leading to an increase—in both absolute and relative terms—in the number of people of productive and child-bearing age. Currently, the number of people entering the workforce is growing markedly, creating a situation rendered problematic by the prevalence of high unemployment rates among young people. Changes in age structure in many countries pose growing challenges in the areas of health and social security, largely as a result of high growth rates among the elderly population.

Added to these trends is the strong urbanization and metropolitanization process that has brought the region—which was predominantly rural in 1950—to its present situation, with 71 per cent of its inhabitants living in urban areas, largely owing to heavy internal migratory flows. Latin America, with less than 10 per cent of the world’s population, has four out of its 10 biggest cities. This situation is not identical in all countries of the region, however, as some of them still have rural populations that account for more than 60 per cent of the total.

It has been observed that development models thus far have promoted the territorial concentration of economic activities and of the population, with the consequent negative implications for comprehensive economic development and for social and regional equity. The Governments of the region are therefore called upon to ensure that their development strategies take into consideration their effects on territorial distribution, and to adopt measures to correct imbalances in this regard.

There is a growing trend towards international population mobility, mainly between the countries of the hemisphere, which is a product of the adjustment process the region is undergoing and of growing disparities between developing and developed countries. This mobility includes, besides the traditional movements of persons at all skill levels seeking better economic conditions, a large contingent of displaced persons and refugees from socio-political conflicts, and others who are returning to their countries of origin, basically motivated by ongoing democratization and pacification.
processes. However, variations may be observed in these patterns of territorial population mobility, as in the case of the Caribbean countries.

Moreover, the full demographic transition occurring in the region does not affect all countries equally. There are sharp contrasts between countries whose women have an average of nearly six children and others where the figure is less than two children; similarly, in some countries, life expectancy at birth is less than 60 years, while in others it is nearly 75. These differences mean that there are countries whose population is growing at a rate of nearly 3 per cent annually, and others where this rate is less than 1 per cent. Similar and even greater disparities are seen in comparing geographical areas or social groups within countries; these disparities are the result of a lack of social equity, which prevents the population from having full, non-discriminatory access to essential services such as education, health care, housing and social security.

Another sign of the lack of equity in the region is discrimination directed against women. From a demographic standpoint, this discrimination is reflected primarily in women's difficulty in exercising their reproductive rights—in other words, in the lack of access or options regarding contraceptive methods, mentioned earlier; in the fact that women are given sole responsibility by family planning programmes; and in the risk of high morbidity and mortality rates associated with pregnancy and childbirth. Special efforts must be made to prevent any lack of equity with respect to women's education and employment status. Consideration must also be given to the specific problems of displaced and refugee women and to violence against women in general.

The region is experiencing problems in the linkages between demographic trends, development and the environment in ecosystems in both urban and rural areas. These conflicts manifest themselves with different degrees of intensity in different countries. Of particular importance is the urban situation, especially in the large metropolises, which are affected by the lack of basic services (water, sewerage, garbage collection) and by water and air pollution resulting from, inter alia, inadequate technologies for their control and insufficient investment in infrastructure, compounded by high urban population growth rates. Rural areas, in turn, suffer from deforestation and soil degradation in areas recently placed under cultivation and also in minifundio areas, where small farmers are forced to overexploit their land.

Sustainable development entails sustained economic growth, based on a change in production patterns combined with social policies—such as employment, population, education and health policies—which ensure social equity and place special emphasis on protecting the environment, all in a framework of democracy and respect for individual rights.

The formulation of population policies that are integrated with development strategies has been and will continue to be a particularly relevant factor. Despite the achievements in this area, some shortcomings can still be detected: a need for a more accurate framework to deal with the form and meaning of the interaction between demographic variables and those of socioeconomic development; a lack, on the one hand, of technical capacity in those responsible for economic and social planning, and, on the other, of firm polit-
ical will to regard population as an endogenous variable in development policies, plans and programmes; and a lack of congruence, in some cases, between the objectives of socio-demographic policies and the effect of economic policies, strategies and programmes. In this sense, the State has an important role to play in coordinating the linkages between population and development.

External debt and its servicing place a heavy burden on Latin American and Caribbean countries that prevents resources from being allocated for development; specifically, it prevents those countries from giving priority to social programmes aimed at raising the population’s standard of living. Consequently, regional consensus-building mechanisms must be created to release resources now used to repay and service debt for the implementation of social development programmes, including those relating to population and development.

International cooperation, both financial and technical, has played an important role in the promotion, study, discussion and implementation of population policies and programmes. However, there exists a notable disproportion between the needs and the resources available. Intraregional cooperation, for its part, is an effective instrument for meeting the common needs of different countries and complementing and strengthening country activities.

RECOMMENDATIONS

Population growth and structure

Recommendation 1. Considering that the size, growth and composition of the population have a major impact on development with equity in the countries of the region, Governments are urged to reiterate and put into practice more fully their political commitment to incorporate demographic variables and, in particular, population growth and structure, at their various levels of policy-making and implementation.

Recommendation 2. Recognizing that recent decreases in fertility in most countries of the region will lead to an increase, in the next few decades, in the proportion of persons of working age, and that this will offer new opportunities by reducing the dependency ratio, but at the same time will present challenges with respect to the demand for job creation, Governments are asked to formulate, with the active support of non-governmental organizations and the private sector, training and employment programmes giving primary importance to young people and to persons affected by technological modernization, with a view to using these human resources to meet development targets.

Recommendation 3. Observing that many countries will continue to experience high rates of growth in the number of women of child-bearing age, together with high rates of adolescent fertility and low rates of contraceptive use, Governments are urged to anticipate demands, particularly those pertaining to reproductive health care.
Recommendation 4. Taking into account the demographic changes expected in most of the countries of the region, including a significant increase in the number of elderly persons, it is recommended that policies be adopted to achieve more equity in the distribution of resources among the various age groups in the fields of health care, education, social security and social participation and integration. The ageing process and the consequent high growth of the elderly population, together with the negative effects on this population of adjustment policies and the decline in public spending on social services, it is imperative that steps be taken to develop the institutional mechanism needed in order to provide social security and health services to this segment of the population, taking into consideration the specific needs of its various age subgroups.

Recommendation 5. Considering that in the short and medium term the population of Latin America and the Caribbean will continue to be relatively young, Governments are urged to strengthen their efforts to provide care for their child and adolescent populations.

Recommendation 6. Considering the inequality which exists in access to health services, Governments are called upon to assign higher political priority and devote more resources to a more equitable distribution of these services between urban and rural areas and among regions within countries and social and ethnic groups, together with ensuring their equitable distribution by gender and age, thereby attempting to reduce the sharp differences that exist in terms of morbidity, infant and maternal mortality and access to reproductive health services.

Recommendation 7. Recognizing also that national global indicators on population growth and demographic structures are important but often insufficient tools in formulating and implementing policies and programmes, it is recommended that the countries redouble their efforts to take due account of the specific features of various social, ethnic, age and subnational groups, in order to reveal the vast demographic heterogeneity underlying national aggregates and thus be able to apply policies that are appropriate to those realities.

Population distribution, development and the environment

Recommendation 8. Recognizing the negative aspects of the process of urban concentration, particularly in large metropolitan areas, it is recommended that decentralization of government decision-making be promoted through the participation of regional and local agents.

Recommendation 9. Considering the strong impact of productive development strategies on migratory flows, Governments are called upon, in designing such strategies, to increase the weight of migration-related considerations, in line with national targets for spatial distribution of the population.

Recommendation 10. Considering the depressed situation prevailing in many rural areas, and the consequent lack of employment opportunities and failure to meet basic needs in those areas, which hamper their ability to retain their population, it is recommended that Governments adopt measures to promote rural development in terms of both the location of production structures and the well-being of the population.
Recommendation 11. Noting that socio-political violence has triggered various forms of enforced territorial mobility of the population, Governments are requested to implement measures to protect the affected population, in particular the most vulnerable groups, such as women, the elderly, children, indigenous populations and ethnic minorities. The international community is also called upon to redouble its financial and technical cooperation efforts with a view to ensuring that repatriation and resettlement programmes are not reduced to merely humanitarian air, but that they contribute to an effective integration of the displaced population into the economic and social development process.

Recommendation 12. Considering that policies and actions related to the environment have an impact on the population’s health and spatial distribution, and that, in turn, population policies are linked in various ways with resource management and environmental conservation, Governments are urged to give priority attention to the quest for programmatic congruence between the two types of policies. In particular, with regard to the seriousness of the environmental problems being faced by a significant proportion of the region’s urban population, the relevant levels of government are called upon to give priority attention to the extension and improvement of basic infrastructures for the provision of essential services, such as drinking water and the disposal or treatment of waste, including household and industrial waste, because of the implications of such services for the state of health and, more generally, the well-being of the population.

Recommendation 13. Considering the risks of environmental degradation entailed by the rapid expansion of human settlements in fragile ecosystems, particularly in rural areas, in both continental and island countries, Governments, together with private agents, are urged to ensure the consideration of long-term action factors that may lead to irreversible environmental damage. Measures to this end should be conceived as part of a process that includes the opening up of alternative options, an adequate set of infrastructure conditions and stimuli to guide the expansion towards preferable zones, and environmentally sound modalities of settlement.

Recommendation 14. Considering that environmental deterioration results from the irrationality of current development patterns, as manifested in the prevalence of inappropriate technologies and consumption patterns, mainly among industrialized countries and privileged minorities in developing countries, and in the worsening standards of living of vast sectors of the population, and that demographic growth is not the main cause of such deterioration, Governments are urged to adopt environmentally sustainable development strategies and, in that context, to give due priority to social programmes and policies, including those on population and education.

Recommendation 15. Considering that the various social actors share responsibility for preserving the environment, Governments are urged to reinforce and expand elements which promote awareness and knowledge about linkages between population variables and environmental variables in education and communication programmes, whether public or private, formal or non-formal. Actions should therefore be grounded on the community, orga-
nized groups and the crucial role played by families and should take into account the important role played by women. What should be created is an ecological awareness of the need to preserve the environment and a clear understanding of the consequences of practices that might be harmful to resources and to the environment, especially those practices that are immediately related to health, education, social well-being and patterns of human settlement.

**Women and population dynamics**

**Recommendation 16.** Considering that stereotypes, prejudices and negative attitudes regarding women and their role in contemporary society persist in the countries of the region, and impede the effective exercise of women’s reproductive rights, Governments are urged to take effective measures designed to eliminate such attitudes by promoting changes in forms of socialization in the mass media and in formal and non-formal education.

**Recommendation 17.** Considering that fuller integration into the educational system and raising women’s level of education are crucial to upgrading their social status, that they are decisive factors in reducing maternal and infant mortality and that they influence reproductive behaviour by affecting the age at which unions first form and the number of children they have, Governments are urged to allocate more resources for the development of programmes that encourage the integration and uninterrupted attendance of women in the educational system, both inside and outside the classroom, particularly through population education and communication programmes, which should incorporate the gender perspective.

**Recommendation 18.** Considering that, in general, women have a low rate of participation in the labour market and are in an unfavourable position within it, in terms of earning lower wages, having less access to social security benefits, representing a larger share of the informal sector and having higher unemployment rates; that certain activities carried out by the female population are undervalued; and that this situation is aggravated by the existence of a high percentage of women heads of households and the fact that many elderly women live alone, Governments and the private sector are urged to facilitate the incorporation of women into the working world on an equal footing with the rest of the population and, in particular, to ensure their access to existing social security programmes.

**Recommendation 19.** Recognizing that most national and international efforts to lower fertility are aimed almost exclusively at women’s reproductive behaviour, Governments are urged to adopt and promote approaches that seek to introduce a gender-equity criterion in this area.

**Recommendation 20.** Taking into account that reproductive rights include that of non-life-threatening maternity, it is recommended that Governments provide universal access to sex education, health programmes, family planning and pre-natal, obstetrical and post-natal care, according priority to the most vulnerable groups of women and, in particular, to the care and prevention of teenage pregnancy, and incorporating the gender perspective, particularly in the case of teenage mothers.
Recommendation 21. Considering that abortion is a major public health issue in the countries of the region and that, while various views are held in this regard, none of them accepts abortion as a method of regulating fertility, generally speaking, it is recommended that the Governments devote greater attention to the study and follow-up of this issue, with a view to evaluating how prevalent abortion really is and its impact on the health of women and their families; Governments should also promote universal access to proper guidance on how to prevent unwanted pregnancies.

Recommendation 22. Considering that the family is the environment which defines the various types of organization of daily life and is, in large part, at the root of gender inequalities, which can lead to forms of violence, Governments are urged to incorporate this aspect into population policies and programmes.

Recommendation 23. Considering that the effectiveness of programmes to achieve gender equity invariably requires strong political will that promotes the solid participation of all sectors of society, it is recommended that, to this end, Governments seek to involve not only the public sector but also non-governmental groups active in the social sphere and the private sector.

Recommendation 24. Considering that sweeping legislative changes have been introduced in the region with a view to eliminating inequalities and discrimination against women as concerns their rights, it is recommended that Governments promote the dissemination of such rights and establish the necessary mechanism for their exercise, ensuring compliance with the Convention on the Elimination of All Forms of Discrimination against Women, designing legal mechanisms to guarantee the equality of pregnant women in the job market and prohibiting the discriminatory work restrictions currently enforced in some countries.

Recommendation 25. Considering the region's experience in the development of women's programmes and the importance of gender-conscious population education and research in formulating further proposals for action, Governments are urged to evaluate the achievements made and to promote the training of qualified personnel in the integration of the gender perspective, incorporating it into population curricula and encouraging research into the influence of gender inequality on the processes of development and demographic change.

Population policies and programmes

Recommendation 26. Considering the essential role of population variables in the task of changing production patterns with social equity in pluralistic, democratic societies, consistent with the basic criteria of environmental sustainability, as well as the right to national sovereignty, Governments are urged, when adopting and implementing population policies, to faithfully reflect the true situation of each country and its various social strata with a view to formulating objectives and targets that, in keeping with the recommendations of Agenda 21, promote the preservation of the ecosystems constituting their national geography and the sound exploitation of their resources.
Recommendation 27. Taking into account that the existing institutional order in the countries of the region is based on respect for individual rights, it is recommended that, beyond basic rights such as education and health care, the effective and equitable exercise of individual rights in areas of demographic concern, especially reproductive behaviour, be promoted in accordance with individual convictions, principles or beliefs.

Recommendation 28. Considering the desirability of having an institutional body responsible for the formulation and implementation of population policy, and considering the multisectoral nature of such policy and the experience of the countries of the region in this area, it is recommended that Governments establish or strengthen the institutional and legal frameworks necessary to ensure the genuine integration of these policies into development strategies. To that end, the experience of each country should be evaluated.

Recommendation 29. Bearing in mind respect for the principle of individual freedom of choice, population education and communication programmes are basic tools for providing guidance and information on this principle. It is therefore recommended that Governments continue implementing such programmes, while respecting the population's cultural diversity and making the necessary changes in order to gear their programmes accordingly. To this end, the evaluation component of these programmes and the exchange of experiences among the countries of the region must be strengthened.

Recommendation 30. Reiterating the need to take an integrated approach in formulating development strategies, and considering that efforts to integrate demographic variables into development planning have been only partially successful, Governments are urged to weigh their experiences and redouble their efforts to give express consideration in their development programmes, in particular at regional and local levels, to both the relevant demographic variables and the impact their development programmes are expected to have on population dynamics. Reaffirming that national Governments are primarily responsible for designing, implementing and evaluating population policies and programmes, it is recommended that these be designed with a view to active participation by organizations and non-governmental organizations, which will bolster the viability and effectiveness of such policies and programmes and, at the same time, help to consolidate democratic systems. To this end, population policies must clearly indicate that the community and non-governmental organizations are equal participants, along with politicians and experts, in policy design, implementation and follow-up. Broad national consensus on population policies is required if they are to have the legitimacy needed for their effective implementation.

Recommendation 31. Bearing in mind the different socio-economic situation of various groups according to age and gender—such as children, youth, women and men of reproductive age and the elderly—specific policies and programmes must be identified for these groups which emphasize efforts to facilitate their integration into society.

Recommendation 32. Considering that a large and, in many cases, growing part of Latin American and Caribbean society is living in poverty or indi-
gence, Governments are requested to increase government spending on social sectors, including population programmes.

**Recommendation 33.** Taking into account that in the region various indigenous peoples have survived in precarious, marginal living conditions and, in many cases, run the risk of extinction, Governments are urged to adopt, in the short term, population policies and programmes for these groups that consider the need to safeguard and protect the specific cultural traits of peoples, while recognizing and respecting their space, land, language and systems of values and beliefs. Governments are also invited to incorporate into their sustainable development strategies the indigenous knowledge accumulated over generations about the conservation of land, natural resources and the environment.

**Development, health, family planning and well-being**

**Recommendation 34.** Considering that the family plays a fundamental role in the reproduction and socialization of future generations, Governments are requested to support the family as an institution through specific policies that take into account changes in its form, its organization and its size and structure. In this connection, family life education, for both men and women, should be promoted through all available means and particularly through population education.

**Recommendation 35.** Recognizing that the opportunity to regulate fertility is a universally recognized human right, it is recommended that Governments ensure the full exercise of this right as one of their prime objectives and provide the accurate, complete information necessary for that purpose. Accordingly, they should provide access to family planning services, expand their coverage and improve their quality, providing care without restriction to all men and women who want it, in a framework of full respect for individual freedoms and for the diversity of socio-cultural and religious beliefs and values.

**Recommendation 36.** Recognizing that family planning programmes, because they help to reduce high-risk pregnancy, cannot be detached from social policies and, in particular, health and education programmes, it is recommended that they be designed as tools for providing health care throughout the reproductive cycle. In this regard, family planning objectives should include reducing maternal and infant morbidity and mortality, lowering the risks of teenage pregnancy and abortion, and preventing sexually transmitted diseases.

**Recommendation 37.** Bearing in mind that acquired immunodeficiency syndrome (AIDS) is a source of growing concern in the countries of the region and that existing projections suggest a significant increase in its incidence in the coming years, and considering also that this syndrome is related to sexual and reproductive behaviour, Governments are urged to incorporate measures into reproductive health, population education and family planning programmes as a matter of priority with the aim of preventing its spread and ensuring that patients receive adequate medical care and non-discriminatory treatment.
Recommendation 38. Taking into account that there are still very pronounced social disparities in most countries as regards, inter alia, income, health, education and place of residence, it is recommended that Governments, in collaboration with non-governmental organizations and the private sector, undertake family planning initiatives, aimed primarily at making this service accessible to the most disadvantaged groups, thereby helping to bring about greater social equity.

Recommendation 39. Considering that teenage pregnancy gives cause for concern because of its impact on maternal and child health, especially in view of the high incidence of maternal morbidity and mortality, and because of its psychological and social repercussions, such as the disruption of schooling, its interference with the mother’s training to enter the labour market and the difficulties it entails for the maintenance of unions, Governments are urged to devote their efforts, on a priority basis, to designing and adopting global reproductive health care models for teenagers, focusing particular attention on population education, with emphasis on family life education, comprehensive sex education and family planning. The design of these models should be tailored to the socio-cultural context in which they are applied. Governments are also urged to reconsider regulations restricting teenagers’ access to birth control methods. The launching of programmes to address the psychological and social consequences of teenage pregnancy, while making every effort to avoid disrupting the mother’s schooling and to facilitate her incorporation into the labour market, is also recommended.

Recommendation 40. Considering the right of individuals, couples and unions to have access to a broad range of methods for regulating their fertility, which, together with the help of professional counselling in the selection of the method most suited to the user’s socio-cultural and personal situation, largely determines the quality and effectiveness of family planning services, Governments are urged to devote special attention to ensuring the genuine availability of a wide variety of contraceptive options and to providing information about what those options involve. It is also necessary to improve the technical skills of service providers, their interpersonal relationship with users and the structure and organization of follow-up services and mechanisms.

Recommendation 41. Considering that tubal ligation is very common in certain countries of the region and concern has been aroused, as this is an irreversible decision that should be taken voluntarily, since it might be regretted at a different stage in life, it is recommended that Governments encourage, at all levels at which such services are provided, the strengthening of advisory mechanisms to inform potential users of sterilization about the existence of alternative contraceptive methods and the consequences of choosing a permanent method. Governments should establish criteria in this regard and clear regulations for their application, and should ensure effective compliance with them.

Recommendation 42. Considering the above-mentioned desirability of having a broad range of available contraceptive methods to choose from, it is recommended that support be given to bio-medical research for the development of contraceptives that are not hazardous to human health, and that local
production thereof be expanded. These actions should be carried out in a manner that also reflects the perspective of the social sciences and human behavioural sciences. International assistance, subject to the approval of the competent national bodies, is an important means of strengthening these efforts.

Recommendation 43. Taking into account that some population groups show a preference for methods based on periodic abstinence, it is recommended that research be extended to cover such methods, seeking to develop more effective procedures for detecting the time of ovulation; to that end, attention must be focused on both the accuracy and simplicity of such methods and the ease with which knowledge about them can be transmitted to the population.

Recommendation 44. Taking into account current trends towards the decentralization of decision-making about social policy and of its management, and recognizing that maternal and child health and family planning programmes are a part of such social policy, Governments are urged to implement a thoroughgoing policy in this regard, allowing for ever greater participation of provincial, departmental and municipal governments; and ensuring sufficient availability of resources. It will also be extremely important to open up channels of communication and to share leadership responsibilities with community organizations, women’s associations, non-governmental organizations and the private sector.

Recommendation 45. Recognizing that, although for purposes of implementing programmes it may be desirable to set targets as to either the number of users or fertility rates, this should not interfere with the exercise of individual freedoms, it is recommended that Governments refrain from establishing quotas for the number of persons that may use the services provided.

Recommendation 46. Considering that, in vast segments of the region’s population, men’s active involvement in decisions about family planning and the use of contraceptive methods is still low and that there is even opposition to contraceptive use by women, it is recommended that specific information, education and communication strategies be introduced in order to rectify this situation. In addition, efforts must be made to promote the education of men in responsible fatherhood and the development and use of contraceptive methods that can be used by men.

Recommendation 47. Considering that information, communication and education on population issues play a decisive role in decision-making concerning reproductive behaviour, Governments are urged to launch programmes in this area or strengthen those already in place. In particular, it is recommended that population education programmes emphasizing preparation for family life and sex education be more rapidly institutionalized in the educational system.

Recommendation 48. Considering that one of the goals of family planning should be to support couples in their efforts to maintain the desired family size, and recognizing the significant progress made by biotechnology in the development of treatments for infertility and assisted fertility, Governments are urged, within their means and their realistic health infrastructure capacities, to provide such services to individuals and support research in this
field within the framework of internationally accepted ethical principles and standards.

Recommendation 49. Considering that future progress in family planning will depend largely on an improved understanding of reality, it is recommended that research in the field be promoted, in particular research on the socio-cultural factors that influence fertility and the dynamics of contraceptive use. It is further recommended that operational research be stepped up with a view to improving the quality of services and of population education and communication programmes.

International migration and development

Recommendation 50. Considering that international migration is a phenomenon that has existed throughout history and will continue to exist owing to political, economic and social disparities between countries, and recognizing that such migration consists, in large part, of undocumented persons who have little formal education and are subjected to discriminatory treatment in the places of transit and destination, Governments of the countries of origin and destination are urged to promote the institutional establishment of international agreements that set forth the necessary norms to oversee the situation of migrant workers and their families and ensure respect for their rights as recognized in various international instruments and conventions.

Recommendation 51. Considering also that some countries receiving immigrants are very small in size, and that uncontrolled immigration has an enormous impact on the demographic and socio-economic structure of these small countries, and particularly of small island developing countries, it is recommended that international bodies recognize the need for, and give support to, ongoing activities related to the measurement and analysis of the impact of these movements on demographic and economic changes. This could enable Governments to better plan and structure programmes to meet basic needs, provide basic services and enhance the quality of life of the population.

Recommendation 52. Also considering the importance of emigration of professionals and technicians and the problems which this type of reverse transfer of technology poses for developing countries, it is recommended that the Governments of developed and developing countries cooperate in establishing adequate infrastructures, by programming development and training human resources in accordance with the needs and priorities of economic and social development; this would generate a suitable national framework that would reduce structural and social imbalances and favour economic and social development, which, in turn, would undoubtedly encourage professionals and technicians to remain in their home countries.

Recommendation 53. Taking into account that qualified human resources are indispensable for furthering development in the region, there is an urgent need for the international community—and international organizations—to seek ways of promoting scientific and technical cooperation between developed and developing countries, with a view to intensifying the transfer of technology to developing countries, under just and favourable conditions, and to facilitating its dissemination and use in those countries. It is
recommended that Governments, in accordance with their national situations and legislation, establish programmes to promote the return and linkage of qualified human resources, for the sake of transferring the knowledge and information needed by their countries of origin.

Recommendation 54. Considering the importance, in some countries of the region, of remittances from abroad for the household economies of groups living in poverty, it is recommended that Governments devise ways of providing guidance to the beneficiary families in the use of savings plans, strengthening their capacity for project management and execution, on a basis of respect for the relevant national legislation.

Recommendation 55. Considering the economic and social integration schemes being implemented at the regional and subregional levels and their consequences for the mobility of individuals within these new spatial configurations and for the operation of national migration policies, it is recommended that Governments progress in cooperating and exchanging information on matters concerning the norms regulating the entry and length of stay of individuals and on their migration policies.

Recommendation 56. Taking into account that these integration schemes result in the formation of socio-economic areas which are broader than those of a single, isolated country, increasing the mobility of resources, Governments are urged to design and elaborate innovative ways of training, recovering and efficiently using the region’s human resources.

Recommendation 57. Considering the frequency of the migration of refugees and of repatriation processes among the countries of the region, Governments are urged to formulate and implement economic and social programmes to guarantee the appropriate reabsorption of these populations; in addition, the international community is invited to continue to develop humanitarian aid and economic and social integration programmes.

Recommendation 58. In view of the serious lack of information and knowledge on trends and policies regarding international migration, it is recommended that the relevant international bodies collaborate with the countries in improving their sources of information, facilitating the exchange of data and research results, and elaborating periodic national and regional reports on international migration which provide adequate information for the formulation of policies and programmes in this field.

Training, data production and research

Recommendation 59. Recognizing the diversity of demographic situations in the region and the need for qualified professionals to address the problems that arise from these different situations, and at the same time taking into account the worsening conditions in which the very small number of regional and national centres and institutions currently operate, it is recommended that Governments and the international community increase their contributions for the training of demographers and experts in the field of population.

Recommendation 60. Considering the importance of demographic issues in many disciplines in the social and biological sciences, Governments
are requested, within the existing university structure, to promote the inclusion of courses on demographic variables into the curricula of these disciplines. At the same time, publications and textbooks containing up-to-date demographic knowledge relevant to the region should be disseminated.

**Recommendation 61.** Taking into account that both the Caribbean countries and the Central American countries have expressed an urgent need to increase the availability of demographers, Governments and cooperation agencies are urged to strengthen national and subregional educational infrastructures in demography and population studies.

**Recommendation 62.** Considering that the availability of adequate socio-demographic information is crucial for sectoral and local development programmes and projects, the Governments of the region are urged to make efforts to strengthen national and regional statistical offices as a precondition for improving their sources and systems of demographic information, with special emphasis on vital statistics and other existing administrative records, with a view to substantiating socio-demographic research and regular follow-up and study of demographic characteristics and trends, particularly in the areas of health, fertility and contraception. Likewise, it is recommended that technical cooperation, both horizontal and with international organizations specializing in demographic research and statistics, be developed in order to contribute to diagnoses and programmes of action targeting vulnerable population groups.

**Recommendation 63.** Considering that in order to further integrate population policies into development plans and programmes, information must be more readily available and knowledge of the relationships between demographic and socio-economic variables must be enhanced, it is recommended that Governments establish an information and data collection and analysis network that takes current development strategies into account in formulating policy and implementing population programmes; Governments should also foster closer interaction between policy makers and researchers in the population field.

**Recommendation 64.** Recognizing that demographic research and population studies have been—with very few exceptions—dependent on the availability of supplementary financial resources, which have almost always come from the outside, or they have been treated as a chapter or an extension of international research programmes, countries are urged to undertake, notwithstanding the continuation of current arrangements, regional and subregional efforts to expand and deepen their knowledge geared to a better understanding of key aspects of population dynamics, and their variables and socio-economic and cultural contextual determinants, as well as the relationship between population, the environment and poverty. Existing national and regional networks of institutions and ad hoc inter-agency agreements or such other mechanisms as are deemed appropriate can be used to this end.

**Recommendation 65.** In order to further integrate population policies into development plans and programmes, and recognizing the significant role of political will in facilitating the achievement of these objectives, Governments are urged to explore, with the assistance of international intergovern-
mental and non-governmental bodies, innovative methods of raising awareness among political leaders, planners and policy-makers of the interrelationship between population and development and the need to incorporate population issues in social and economic programmes.

Recommendation 66. Taking into account that new internal migration patterns are emerging in the region which have not yet been looked into sufficiently, and that the policies applied so far to influence the spatial distribution of the population have not been adequately assessed, Governments are called upon to promote research and studies on this matter, in coordination with universities, academic centres and other non-governmental organizations.

Recommendation 67. Noting that the problems of the environment transcend conventional political and administrative boundaries, Governments are requested, in conducting studies on demographic trends and territorial mobility of the population, to recognize ecosystems as units of analysis, incorporating them into the pertinent chapters of the statistical system. This approach is particularly relevant in those subregions where regional or border integration initiatives are being taken.

Recommendation 68. Considering that the international community has stressed the importance of sustainable development, as set out in Agenda 21, and that the sustainability of development simultaneously depends on production and consumption patterns, demographic trends and the dynamic linkages between the two; and bearing in mind that the accumulated knowledge on these matters is still insufficient, it is considered essential to promote interdisciplinary studies, at national and subnational levels, to incorporate these linkages into the design of development policies and programmes.

International cooperation in the population field

Recommendation 69. Recognizing that the mobilization of international financial and technical resources is essential to ensure the implementation of the recommendations contained in this Consensus, Governments of the developed countries members of the Economic Commission for Latin America and the Caribbean (ECLAC), other bilateral donors and global and regional multilateral organizations are urged to substantially increase their allocations of resources for population assistance.

Recommendation 70. Considering that cooperation needs in the population sector are growing and dynamic, and require ongoing attention, it is recommended that official development assistance include specific, increasing appropriations for population activities to the year 2000. Given the nature of this topic, the use of such appropriations should be based on flexible criteria, allowing for their adaptation to the numerous problems in this sector.

Recommendation 71. Taking into account the experience acquired by a number of Latin American and Caribbean countries in the design and implementation of policies and programmes in the various areas covered by this Consensus, it is recommended that Governments increase technical cooperation activities between countries of the region, and international organizations are urged to support such activities.

102
Recommendation 72. Bearing in mind that there has been a real decrease in the resources of the Latin American Demographic Centre (CELADE) and that this seriously limits the attention that can be given to current and future training and research needs in the field of population and development, primarily in Central America and the Caribbean, it is recommended that the Presiding Officers of the Committee of High-level Government Experts (CEGAN), in consultation with the ECLAC secretariat, explore and investigate new forms and sources of financing to strengthen CELADE in order to benefit countries and satisfy their requirements.

Taking into account the national, regional, interregional and global dimensions of the recommendations adopted, member countries call upon the relevant national and multilateral institutions to implement them according to their capacity and to adopt the legislation required for their implementation.

The members and associate members take into account the role of non-governmental organizations in the implementation of the recommendations contained in the present Consensus and reiterate their support for mechanisms to ensure democratic participation in the identification, preparation and implementation of policies, programmes and projects, with a view to involving the beneficiaries thereof directly.

Considering the importance of this Consensus, the member States decide to promote the adoption of a regional plan of action based on the recommendations contained herein, request the ECLAC secretariat to elaborate a draft thereof, and invite ECLAC to seek the collaboration of the United Nations Population Fund (UNFPA). The member States also ask the Presiding Officers of CEGAN and all interested countries to take measures to establish communication mechanisms and to provide the ECLAC secretariat with appropriate guidelines. This plan will be presented at the twenty-fifth session of ECLAC, to be held at Cartagena, Colombia, and submitted as a contribution to the preparatory process for the International Conference on Population and Development, to be held at Cairo in September 1994.

Taking into account the forthcoming International Conference on Population and Development, to be held at Cairo in September 1994, the Governments of the region pledge to participate actively in it by contributing to the discussion of policies from their national viewpoints and from a regional perspective, and by working to ensure that the updated World Population Plan of Action reflects the specific characteristics of the Latin American and Caribbean region, in harmony with those of other developing regions and with the general interests of the rest of the world.

In view of the new dimension that will infuse population and development issues following the Cairo Conference, the States Members of the United Nations are urged to take the necessary institutional steps to endow UNFPA with the instruments it needs to apply the World Population Plan of Action, and ECLAC and CELADE with similar instruments for action at the regional level.

Mindful that international population and development issues, including environmental concerns, have an impact on all member and associate member
countries of ECLAC, and further mindful that the contributions, in particular of associate member countries, to international cooperation in population and development enhance the international process in addressing these issues while also assisting these countries in their socio-economic development, the Preparatory Committee of the International Conference on Population and Development is urged to include in its rules of procedure provisions for extending observer status in the preparatory process and at the International Conference on Population and Development to associate members of regional economic commissions, consistent with the extension of such a status to these countries at the United Nations Conference on Environment and Development.

By adopting this Consensus, the countries of Latin America and the Caribbean express their commitment to applying their recommendations and to taking the necessary steps to that end at the institutional level and in the domestic mobilization of resources within the prioritization of social development and comprehensive assistance to women and children.
HOW TO OBTAIN UNITED NATIONS PUBLICATIONS

United Nations publications may be obtained from bookstores and distributors throughout the world. Consult your bookstore or write to: United Nations, Sales Section, New York or Geneva.

COMMENT SE PROCURER LES PUBLICATIONS DES NATIONS UNIES

КАК ПОЛУЧИТЬ ИЗДАНИЯ ОРГАНИЗАЦИИ ОБЪЕДИНЕННЫХ НАЦИЙ

Издания Организации Объединенных Наций можно купить в книжных магазинах и агентствах во всех районах мира. Наводите справки об изданиях в вашем книжном магазине или пишите по адресу: Организация Объединенных Наций, Секция по продаже изданий, Нью-Йорк или Женева.

COMO CONSEGUIR PUBLICACIONES DE LAS NACIONES UNIDAS

Las publicaciones de las Naciones Unidas están en venta en librerías y casas distribuidoras en todas partes del mundo. Consulte a su librero o diríjase a: Naciones Unidas, Sección de Ventas, Nueva York o Ginebra.
